ABSTRACT

New classes of sets called β^* -closed sets are introduced and studied some of their properties.

Keywords: *g-closed, *g-open, \tilde{g} -closed, \tilde{g} open, ρ -closed, $\hat{\eta}^*$ -closed, β^* -closed

Mathematics subject classification: 54A05, 54A10, 54D10.

1. INTRODUCTION

The study of generalized closed sets in topological space was initiated by Levin [4]. In 1986 Andrijevic [2] defined semi pre open sets and it is also known under the name β -closed sets. In 1996, Julian Dontchev [3] introduced the notion of generalized semi-pre closed (briefly *gsp-closed sets*) via the concept of semi pre open sets. Generalised closed sets namely g-closed sets, gs closed sets, r-g closed sets, s-g closed sets, α -closed sets, α -g closed sets were introduced and studied by various authors. The class of *gsp-closed sets* contains properly the classes of all the above mentioned generalised closed sets except r-g closed sets. The class of ω -closed set was introduced by M. Shiek John [11] in 2002. In this paper we introduce a new classes of sets called β^* Closed sets. This class lies between the class of open and semi pre closed sets and the class of $\hat{\eta}^*$ -closed sets [9].

2. PRELIMINARIES

Throughout this paper (X, τ) , (Y, σ) and (Z, η) will always denote topological spaces, on which no separation axioms are assumed unless otherwise mentioned. When A is a subset of (X, τ) , $Cl(A)$, $Int(A)$ and $D[A]$ denote the closure, the interior and the derived set of A, respectively.

We recall some known definitions needed.

Definitions 2.1: Let (X, τ) be topological space. A subset A of X is said to be

1. Preopen [7] if $A \subseteq Int(Cl(A))$ and preclosed if $Cl(Int(A)) \subseteq A$.
2. Semi open [6] if $A \subseteq Cl(Int(A))$ and semi closed if $Int(Cl(A)) \subseteq A$.
3. Semi pre open [1] if $A \subseteq Cl(Int(Cl(A)))$ and semi pre closed if $Int(Cl(Int(A))) \subseteq A$.

Definition 2.2: Let (X, τ) be a topological space. A subset A of X is said to be

1. generalised closed (briefly g-closed) [5] if $Cl(A) \subseteq U$ whenever $A \subseteq U$ and U is open in X.
2. generalized pre closed (briefly gp-closed) [8] if $Pcl(A) \subseteq U$ whenever $A \subseteq U$ and U is open in X.
3. generalized semi pre closed (briefly *gsp-closed*) [3] if $Spcl(A) \subseteq U$ whenever $A \subseteq U$ and U is open in X.
4. ω -closed if [11] if $Cl(A) \subseteq U$ whenever $A \subseteq U$ and U is semi open in X.
5. *g-closed if [12] if $cl(A) \subseteq U$ whenever $A \subseteq U$ and U is ω -open in X.
6. #gs-closed [13] if $Scl(A) \subseteq U$ whenever $A \subseteq U$ and U is *g-open in X.
7. \tilde{g} -closed [4] if $cl(A) \subseteq U$ whenever $A \subseteq U$ and U is #gs-open.
8. ρ -closed [10] if $Pcl(A) \subseteq Int(U)$ whenever $A \subseteq U$ and U is \tilde{g} open in X.
9. $\hat{\eta}^*$ -closed [9] if $Spcl(A) \subseteq Int(Cl(U))$ whenever $A \subseteq U$ and U is ω -open in X.

*Corresponding author: Wellington Daniel, *E-mail: lwellingtondaniel7@yahoo.in

The compliments of above mentioned sets are called their respective closed sets.

Basic Properties Of β^* Closed Sets

We introduce the following **Definition**

Definition 3.1: A subset A of a space (X, τ) is said to be β^* - closed in (X, τ) if $\text{spcl}(A) \subseteq \text{Int}(U)$ whenever $A \subseteq U$ and U is ω -open in (X, τ)

Theorem 3.2: Every open and semi preclosed subset of (X, τ) is β^* - closed but not conversely.

Proof: Let A be an open and semi preclosed subset of (X, τ)

Let $A \subseteq U$ and U be ω -open in X

Then $\text{spcl}(A) = A = \text{Int}(A) \subseteq \text{Int}(U)$

Hence A is β^* closed

The converse of the above **Theorem** need not be true as seen from the following example

Example 3.3: Let $X = \{a, b, c, d\}$ and $\tau = \{\emptyset, \{a\}, X\}$

Then the set $A = \{a, c\}$ is β^* closed but neither open nor preclosed

Theorem 3.4: Every β^* - closed set is gsp – closed but not conversely.

Proof: Let A be any β^* - closed set in X

Let $A \subseteq U$ and U be open in X

Since every open set is ω -open and A is β^* - closed $\text{Spcl}(A) \subseteq \text{Int}(U) = U$

Hence A is gsp – closed

Converse of the above **Theorem** need not be true as seen from the following

Example 3.5: Let $X = \{a, b, c\}$ and $\tau = \{\emptyset, \{a\}, \{b, c\}, X\}$

Then the set $A = \{a, b\}$ is gsp closed but not β^* - closed in X

Theorem 3.7: Every open and preclosed subset of (X, τ) is β^* - closed

Proof: Let A be an open and preclosed subset of (X, τ)

Let $A \subseteq U$ and U be ω -open in X

Then $\text{spcl}(A) \subseteq \text{pcl}(A) = A = \text{Int}(A) \subseteq \text{Int}(U)$

Hence A is β^* - closed

The converse of the above **Theorem** need not be true. It is seen from the following example.

Example 3.8: Let $X = \{a, b, c, d\}$ and $\tau = \{\emptyset, \{a\}, X\}$

Then the set $\{a, b\}$ is β^* - closed but neither open are preclosed.

Remark 3.9: β^* - closedness and preclosedness are independent. It is shown by the following examples.

Example 3.10: Let $X = \{a, b, c\}$ and $\tau = \{\emptyset, \{a\}, \{b\}, \{a, b\}, X\}$

Then the set $A = \{a\}$ is β^* - closed but not preclosed.

Example 3.11: Let $X = \{a, b, c\}$ and $\tau = \{\emptyset, \{a\}, \{b, c\}\}$

Then the set $A = \{a, b\}$ is preclosed but not β^* - closed

Remark 3.12: β^* - closedness and α -closedness are independent. It is shown by the following examples.

Example 3.13: Let $X = \{a, b, c\}$ and $\tau = \{\emptyset, \{a\}, \{b, c\}, X\}$

Then the set $A = \{a\}$ is α -closed but not β^* - closed

Example 3.14: Let $X = \{a, b, c, d\}$ and $\tau = \{\emptyset, \{a\}, X\}$

Then the set $\{a, b\}$ is β^* - closed but not α -closed.

Remark 3.15: β^* - closed sets are independent of semi closed sets and semi preclosed sets. It is shown by the following examples.

Example 3.16: Let $X = \{a, b, c\}$ and $\tau = \{\emptyset, \{a\}, \{b, c\}, X\}$

Then the set $A = \{a, b\}$ is both semi preclosed and semi closed but not β^* - closed.

Example 3.17: Let $X = \{a, b, c\}$ and $\tau = \{\emptyset, \{a\}, \{a, c\}, X\}$

Then the set $A = \{a, b\}$ is β^* - closed but neither semi preclosed nor semi closed.

Remark 3.18: β^* - closedness and pre semi closedness are independent. It is shown by the following examples.

Example 3.19: Let $X = \{a, b, c\}$ and $\tau = \{\emptyset, \{a, b\}, X\}$

Then the set $A = \{a\}$ is pre semi closed but not β^* - closed.

Example 3.20: Let $X = \{a, b, c, d\}$ and $\tau = \{\emptyset, \{a\}, X\}$

Then the set $A = \{a, b\}$ is β^* - closed but not pre semi closed.

Remark 3.21: β^* - closedness and g closedness are independent. It is shown by the following examples.

Example 3.22: Let $X = \{a, b, c\}$ and $\tau = \{\emptyset, \{a\}, \{b, c\}, X\}$

Then the set $A = \{a, c\}$ is g closed but not β^* - closed.

Example 3.23: Let $X = \{a, b, c\}$ and $\tau = \{\emptyset, \{a\}, \{b\}, \{a, b\}, X\}$

Then the set $A = \{b\}$ is β^* - closed but not g closed.

Theorem 3.24: β^* - closed set is $\widehat{\eta^*}$ closed set but not conversely.

Proof: Let A be any β^* - closed set in X .

Let $A \subseteq U$ and U be ω -open in X .

Then $\text{spcl}(A) \subseteq \text{Int}(U) \subseteq U$

Hence A is $\widehat{\eta^*}$ closed

Converse of the above **Theorem** need not be true. It is seen from the following example

Example 3.25: Let $X = \{a, b, c, d, e\}$ and $\tau = \{\emptyset, \{a, b\}, \{a, b, d\}, \{a, b, c, d\}, \{a, b, d, e\}, X\}$

Then the set $A = \{a\}$ is $\widehat{\eta^*}$ closed but not β^* - closed

Example 3.26: β^* - closedness and ρ closedness are independent. It is shown by the following examples.

Example 3.27: Let $X = \{a, b, c, d, e\}$ and $\tau = \{\emptyset, \{a, b\}, \{a, b, d\}, \{a, b, c, d\}, \{a, b, d, e\}, X\}$

Then the set $A = \{c\}$ is β^* closed but not ρ - closed

Then the set $B = \{b, d\}$ is ρ closed but not β^* - closed.

Definition 3.28: A subset A of a space (X, τ) is said to be β^* s- closed in (X, τ) if $\text{spcl}(A) \subseteq \text{Int}(\text{cl}(U))$ whenever $A \subseteq U$ and U is ω -open in (X, τ) .

Theorem 3.29: Every β^* - closed set is β^* s- closed but not conversely.

Proof: Let A be any β^* - closed set.

Let $A \subseteq U$ and U be ω -open

A is β^* - closed, $\text{spcl}(A) \subseteq \text{Int}(U) \subseteq \text{Int}(\text{cl}(U))$

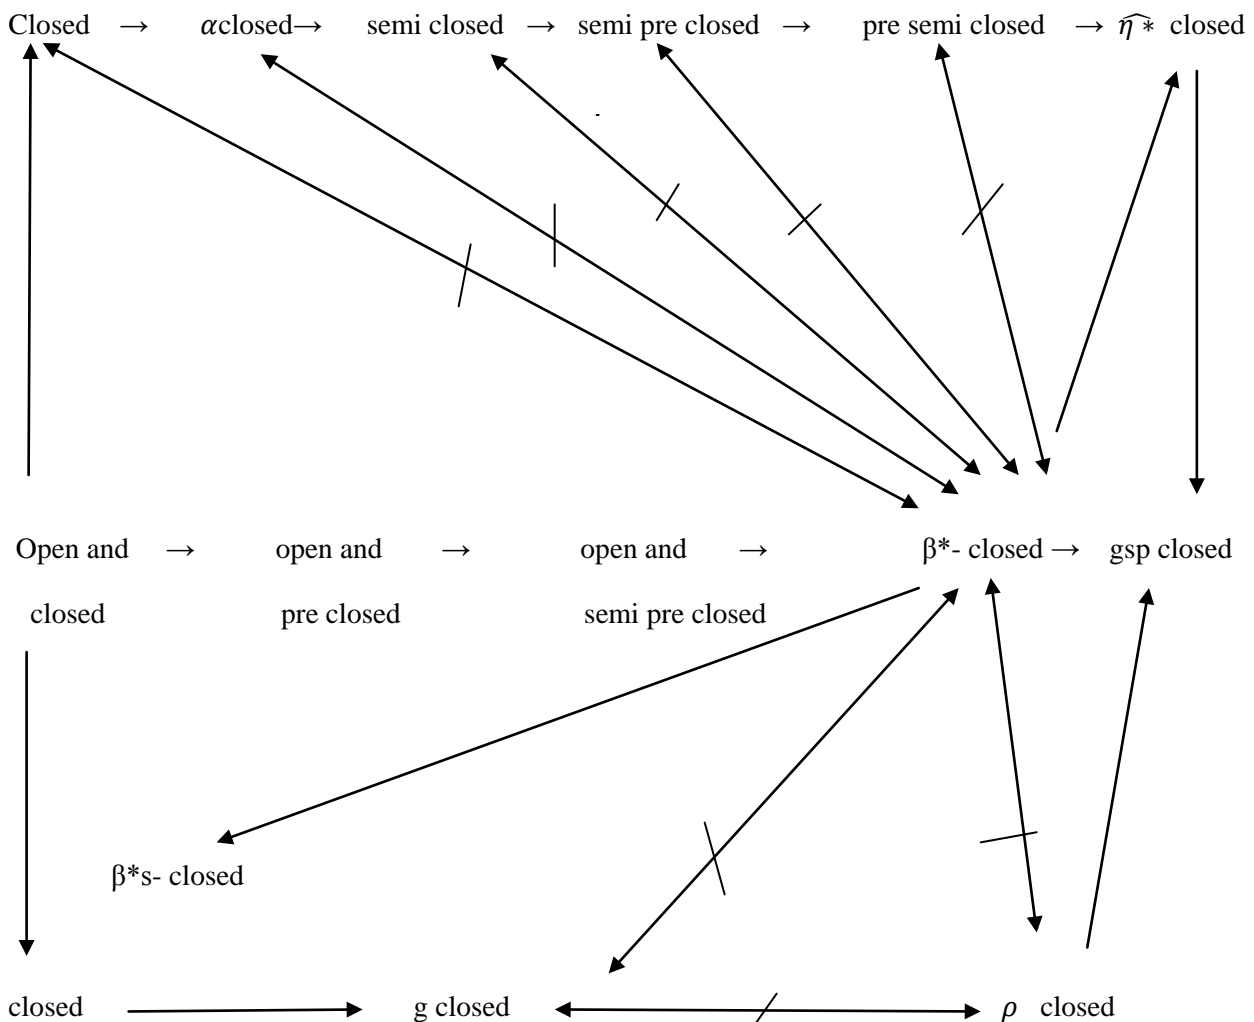

Hence A is β^* s- closed.

The converse of the above **Theorem** need not be true. It is seen from the following example.

Example 3.30: Let $X = \{a, b, c, d, e\}$ and $\tau = \{\emptyset, \{a, b\}, \{a, b, d\}, \{a, b, c, d\}, \{a, b, d, e\}, X\}$

Then the set $A = \{b, d\}$ is β^* s- closed but not β^* - closed

Remark 3.31: From the above discussion and known results we have the following implications. $A \rightarrow B$ represents A implies B but not conversely and $A \leftrightarrow B$ represents A and B are independent of each other

Properties Of β^* Closed Sets

Remark 3.32: The union and intersection of two β^* - closed sets need not be β^* - closed. It is shown in the following examples.

Example 3.33: Let $X = \{a, b, c, d\}$ and $\tau = \{\phi, \{a\}, X\}$

Then set $A = \{a, b\}$ and $B = \{a, c\}$ are β^* - closed but $A \cap B = \{a\}$ is not β^* - closed

2. Let $X = \{a, b, c\}$ and $\tau = \{\phi, \{a\}, \{b\}, \{a, b\}, X\}$

Then set $A = \{a\}$ and $B = \{b\}$ are β^* - closed but $A \cup B = \{a, b\}$ is not β^* - closed

Theorem 3.34: A set A is β^* - closed Then $\text{spcl}(A) - A$ contains no non empty closed set.

Proof: Suppose $H \subseteq \text{spcl}(A) - A$ is a non empty closed set

Then $H \subseteq \text{spcl}(A)$ and $A \subseteq X - H$. Since $X - H$ is ω - open and A is β^* - closed, we have $\text{spcl}(A) \subseteq \text{Int}(X - H) = X - \text{cl}(A)$.

Hence $\text{cl}(H) \subseteq X - \text{spcl}(A)$. which is a contradiction.

Hence $\text{spcl}(A) - (A)$ contains no non empty closed set. Converse of the above

Theorem need not be true as seen from the following example.

Example 3.35: Let $X = \{a, b, c\}$ and $\tau = \{\phi, \{a\}, \{b, c\}, X\}$

Let $A = \{a, c\}$ Then $\text{spcl}(A) - (A) = \{a, c\} - \{a, c\} = \phi$ contains no non empty closed set but A is not β^* - closed

Theorem 3.36: A set A is β^* - closed Then $\text{spcl}(A) - (A)$ contains no non empty ω -closed sets.

Proof: Let F be a non empty ω -closed set of $F \subseteq \text{spcl}(A) - (A)$. Then $F \subseteq \text{spcl}(A)$ and $A \subseteq X - F$. Since A is β^* - closed and $X - F$ is ω -open. We have $\text{spcl}(A) \subseteq \text{Int}(X - F) = X - \text{cl}(F)$. Hence $\text{cl}(F) \subseteq X - \text{spcl}(A)$ and so $F \subseteq X - \text{spcl}(A)$.

Already $F \subseteq \text{spcl}(A)$ hence we get a contradiction. Hence $\text{spcl}(A) - (A)$ contains no non empty ω - closed set.

Theorem 3.37: If A is β^* - closed and $A \subseteq B \subseteq \text{spcl}(A)$ Then B is β^* - closed

Proof: Let U be a ω - open set of X such that $B \subseteq U$. Since $A \subseteq U$ and U is ω - open we have $\text{spcl}(A) \subseteq \text{Int}(U)$. We have $B \subseteq \text{spcl}(A)$ and so $\text{spcl}(B) \subseteq \text{spcl}(\text{spcl}(A)) = \text{spcl}(A)$. Hence $\text{spcl}(A) \subseteq \text{Int}(U)$ and so B is β^* - closed

Theorem 3.38: If a subset A of (X, τ) is ω - open and β^* - closed Then A is semipreclosed in (X, τ) .

Proof: If A is ω - open and β^* - closed, since $A \subseteq A$, we have $\text{spcl}(A) \subseteq \text{Int}(A) \subseteq A$. but $A \subseteq \text{spcl}(A)$. Hence $A = \text{spcl}(A)$. So A is semipreclosed.

Lemma 3.39: If A is open and gsp closed. Then A is semi pre closed.

Proof: Let $A \subseteq U$ and U be open in (X, τ) , since A is open and $A \subseteq A$, we have $\text{spcl}(A) \subseteq A \subseteq U$, hence $\text{spcl}(A) \subseteq U$ and so A is semi pre closed.

Theorem 3.40: A open set of (X, τ) is gsp closed if and only if A is β^* - closed.

Proof: Let A be a open set of (X, τ) and A is gsp closed.

Let $A \subseteq U$ and U be ω - open in (X, τ) , since A is open and gsp closed by the lemma 3.39; A is semi pre closed. Hence $\text{spcl}(A) = A = \text{Int}(A) \subseteq \text{Int}(U)$, therefore $\text{spcl}(A) \subseteq \text{Int}(U)$ and so A is β^* - closed. Conversely let A be a β^* - closed set. Then by Theorem 3.4, A is gsp closed.

Theorem 3.41: Let A be β^* - closed in (X, τ) Then A is semi pre closed if and only if $\text{spcl}(A) - (A)$ is ω closed.

Proof: Let A be semi pre closed. Then $\text{spcl}(A) = (A)$ and so $\text{spcl}(A) - (A) = \emptyset$ which is ω closed. Conversely Let $\text{spcl}(A) - (A)$ is ω closed, Since A is β^* - closed by **Theorem 3.36** $\text{spcl}(A) - A$ contains no non empty ω - closed set.

Hence $\text{spcl}(A) - (A) = \emptyset$ which implies $\text{spcl}(A) = (A)$ and so A is semi pre closed

Definition 3.42: Let (X, τ) be a topological space and $A \subseteq X$ and $x \in X$, Then x is said to be a semi pre limit point of A if every semi pre open set containing x contains a point of A different from x.

Definition 3.43: Let (X, τ) be a topological space and $A \subseteq X$, the set of all semi pre limit point of A is said to be semi pre derived set of A and is denoted by $D_{\text{sp}}[A]$

Theorem 3.44: If $D[A] \subseteq D_{\text{sp}}[A]$ for each subset A of a space (X, τ) , Then the union of two β^* - closed set is β^* -closed.

Proof: Let A and B be β^* - closed subsets of X and U be ω - open set with $A \cup B \subseteq U$, Then $\text{spcl}(A) \subseteq \text{Int}(U)$ and $\text{spcl}(B) \subseteq \text{Int}(U)$. Since for each subset A of X, we have $D_{\text{sp}}[A] \subseteq D[A]$, we get $\text{cl}(A) = \text{spcl}(A)$ and $\text{cl}(B) = \text{spcl}(B)$, therefore $\text{cl}(A \cup B) = \text{cl}(A) \cup \text{cl}(B) = \text{spcl}(A) \cup \text{spcl}(B) \subseteq \text{Int}(U)$, but $\text{spcl}(A \cup B) \subseteq \text{cl}(A \cup B)$. So $\text{spcl}(A \cup B) \subseteq \text{cl}(A \cup B) \subseteq \text{Int}(U)$, hence $A \cup B$ is β^* - closed
