ABSTRACT

We introduce a new type of sets called m -A set, m -t set, m -B set, m -h set and m -C set and a new class of mappings called M -A continuous, M -B continuous and M -C continuous. We obtain several characterizations of this class and study its minimal properties and investigate the relationships with other mappings like M - α -continuous.

2010 Mathematics Subject Classifications: 54A05, 54C08.

Keywords and Phrases: minimal space, m -A set, m -B set, m -C set, M -A continuity, M -B continuity, M -C continuity.

1. INTRODUCTION

Njastad [7] initiated the concept of nearly open sets in topological spaces. Following it many research papers were introduced by Tong [11, 12], Hatir [3, 4, 5], Dontchev [1] and Ganster [2] in the name of “Decompositions of Continuity” in topological spaces. It is an effort based on them to bring out a paper in the name of “Decompositions of M -continuity” in minimal spaces using the new sets like m -A set, m -B set and m -C set and the new mappings like M -A continuous, M -B continuous and M -C continuous. In this paper, we obtain some important results in minimal spaces. In most of the occasions, our ideas are illustrated and substantiated by suitable examples.

2. PRELIMINARIES

Definition 2.1: [6, 8] Let X be a nonempty set and $\wp(X)$ the power set of X . A subfamily m_x of $\wp(X)$ is called a minimal structure (briefly, m -structure) on X if $\phi \in m_x$ and $X \in m_x$.

A set X with an m -structure m_x is called an m -space and is denoted by (X, m_x) . Each member of m_x is said to be m_x -open and the complement of an m_x -open set is said to be m_x -closed. Throughout this paper, (X, m_x) (or X) denotes minimal space.

Throughout this paper, (X, m_x) (or X) denotes minimal space.

Definition 2.2: [6, 8] Let X be a nonempty set and m_x an m -structure on X . For a subset A of X , the m_x -closure of A and the m_x -Interior of A are defined as follows:

- (1) $m_x\text{-Cl}(A) = \bigcap \{ F : A \subset F, X - F \in m_x \}$,
- (2) $m_x\text{-Int}(A) = \bigcup \{ U : U \subset A, U \in m_x \}$.

Lemma 2.3: [6, 8] Let X be a nonempty set and m_x a minimal structure on X . For subsets A and B of X , the following properties hold :

- (1) $m_x\text{-Cl}(X - A) = X - m_x\text{-Int}(A)$ and $m_x\text{-Int}(X - A) = X - m_x\text{-Cl}(A)$,
- (2) If $(X - A) \in m_x$, then $m_x\text{-Cl}(A) = A$ and if $A \in m_x$, then $m_x\text{-Int}(A) = A$,

Corresponding author: O. Ravi, *E-mail: siingam@yahoo.com

- (3) $m_x\text{-Cl}(\phi) = \phi$, $m_x\text{-Cl}(X) = X$, $m_x\text{-Int}(\phi) = \phi$ and $m_x\text{-Int}(X) = X$,
 (4) If $A \subset B$, then $m_x\text{-Cl}(A) \subset m_x\text{-Cl}(B)$ and $m_x\text{-Int}(A) \subset m_x\text{-Int}(B)$,
 (5) $A \subset m_x\text{-Cl}(A)$ and $m_x\text{-Int}(A) \subset A$,
 (6) $m_x\text{-Cl}(m_x\text{-Cl}(A)) = m_x\text{-Cl}(A)$ and $m_x\text{-Int}(m_x\text{-Int}(A)) = m_x\text{-Int}(A)$.

Definition 2.4: [8] A minimal space m_x on a nonempty set X is said to have property \mathfrak{B} if the union of any family of subsets belonging to m_x belongs to m_x .

Lemma 2.5: [8] The following are equivalent for the minimal space (X, m_x) .

- (1) m_x have property \mathfrak{B} ;
 (2) If $m_x\text{-Int}(E) = E$, then $E \in m_x$;
 (3) If $m_x\text{-Cl}(F) = F$, then $F^c \in m_x$.

Definition 2.6: [9] Let S be a subset of X . Then S is said to be

- (i) $m_x\text{-}\alpha$ -open if $S \subseteq m_x\text{-Int}(m_x\text{-Cl}(m_x\text{-Int}(S)))$;
 (ii) m_x -semi-open if $S \subseteq m_x\text{-Cl}(m_x\text{-Int}(S))$;
 (iii) m_x -preopen if $S \subseteq m_x\text{-Int}(m_x\text{-Cl}(S))$.

The family of all $m_x\text{-}\alpha$ -open [resp. m_x -semi-open, m_x -preopen] sets of X is denoted by $m_x\text{-}\alpha O(X)$ [resp. $m_x\text{-SO}(X)$, $m_x\text{-PO}(X)$].

Remark 2.7: [9]

- (i) Every m_x -open set is $m_x\text{-}\alpha$ -open but not conversely.
 (ii) A m_x -semi-open [m_x -preopen] set need not be $m_x\text{-}\alpha$ -open.

Example 2.8: Let $Y = \{p, q, r\}$ and $m_y = \{\phi, Y, \{p\}, \{q\}, \{p, q\}\}$. We have

$$m_y\text{-}\alpha O(Y) = \{\phi, Y, \{p\}, \{q\}, \{p, q\}\}; m_y\text{-SO}(Y) = \{\phi, Y, \{p\}, \{q\}, \{p, q\}, \{p, r\}, \{q, r\}\} \text{ and}$$

$$m_y\text{-PO}(Y) = \{\phi, Y, \{p\}, \{q\}, \{p, q\}\}.$$

Definition 2.9: A minimal space (X, m_x) has the property I if the any finite intersection of m -open sets is m -open.

Remark 2.10: For subsets A and B of a minimal space (X, m_x) satisfying property I , the following holds:

$$m\text{-Int}(A \cap B) = m\text{-Int}(A) \cap m\text{-Int}(B).$$

Example 2.11.: For subsets A and B of a minimal space (X, m_x) satisfying property \mathfrak{B} , the following does not hold:

$$m\text{-Int}(A \cap B) = m\text{-Int}(A) \cap m\text{-Int}(B).$$

Let $X = \{a, b, c, d\}$, $m_x = \{\phi, X, \{a\}, \{a, b\}, \{a, c\}, \{b, c\}, \{a, b, c\}\}$. Let $A = \{a, b\}$ and $B = \{b, c\}$. Then $A \cap B = \{b\}$. We have $m\text{-Int}(A) = \{a, b\}$; $m\text{-Int}(B) = \{b, c\}$ and $m\text{-Int}(A) \cap m\text{-Int}(B) = \{b\}$. But $m\text{-Int}(A \cap B) = \phi$. Hence $m\text{-Int}(A \cap B) \neq m\text{-Int}(A) \cap m\text{-Int}(B)$.

3. m-C SETS:

We introduce a new type of sets as follows:

Definition 3.1: A subset S of X is said to be

- (i) regular m -open [10] if $S = m\text{-Int}(m\text{-Cl}(S))$,
 (ii) regular m -closed if $S = m\text{-Cl}(m\text{-Int}(S))$.

The family of all regular m -closed sets of X is denoted $m\text{-RC}(X)$.

Definition 3.2: A subset S of X is said to be

- (i) a m - A set if $S = M \cap N$ where M is m -open and $N \in m\text{-RC}(X)$,
 (ii) a m - t set if $m\text{-Int}(m\text{-Cl}(S)) = m\text{-Int}(S)$,

- (iii) a m-B set if $S = M \cap N$ where M is m-open and N is a m-t set,
- (iv) a m-h set if $m\text{-Int}(m\text{-Cl}(m\text{-Int}(S))) = m\text{-Int}(S)$,
- (v) a m-C set if $S = M \cap N$ where M is m-open and N is a m-h set.

Example 3.3: Let $X = \{a, b, c\}$ and $m_x = \{\phi, X, \{a\}, \{b\}, \{a, b\}\}$. Then the sets in $\{\phi, X, \{b, c\}, \{a, c\}, \{c\}\}$ are called m_x -closed.

Example 3.4: Let $X = \{a, b, c\}$ and $m_x = \{\phi, X, \{a\}, \{c\}, \{a, b\}, \{a, c\}\}$. Then the sets in $\{\phi, X, \{b, c\}, \{a, b\}, \{c\}, \{b\}\}$ are called m_x -closed.

Example 3.5: Let $X = \{a, b, c\}$ and $m_x = \{\phi, X, \{a, b\}, \{b, c\}\}$. Then the sets in $\{\phi, X, \{c\}, \{a\}\}$ are called m_x -closed.

Remark 3.6: It is evident that any m-open set of X is an m- α -open and each m- α -open set of X is both m-semi-open and m-preopen. But the separate converses are not true.

Theorem 3.7: If A and B are two m-t sets of a space X satisfying property I, then $A \cap B$ is a m-t set in X .

Proof: Since $A \subset m\text{-Cl}(A)$, $m\text{-Int}(A \cap B) \subset m\text{-Int}(m\text{-Cl}(A \cap B)) \subset m\text{-Int}(m\text{-Cl}(A) \cap m\text{-Cl}(B)) = m\text{-Int}(m\text{-Cl}(A)) \cap m\text{-Int}(m\text{-Cl}(B)) = m\text{-Int}(A) \cap m\text{-Int}(B)$ (since A, B are m-t sets) $= m\text{-Int}(A \cap B)$. Thus $m\text{-Int}(m\text{-Cl}(A \cap B)) = m\text{-Int}(A \cap B)$ and $A \cap B$ is m-t set.

Theorem 3.8: If A is a m-t set of X and $B \subseteq X$ with $A \subseteq B \subseteq m\text{-Cl}(A)$ then B is a m-t set.

Proof: We note that $m\text{-Cl}(B) \subseteq m\text{-Cl}(A)$. So we have $m\text{-Int}(B) \subseteq m\text{-Int}(m\text{-Cl}(B)) \subseteq m\text{-Int}(m\text{-Cl}(A)) = m\text{-Int}(A) \subseteq m\text{-Int}(B)$. Thus $m\text{-Int}(B) = m\text{-Int}(m\text{-Cl}(B))$ and therefore B is a m-t set.

Remark 3.9: The union of two m-h sets need not be a m-h set. Refer Example 3.3, $\{a\}$ and $\{b\}$ are m-h sets but $\{a, b\}$ is not m-h set.

Remark 3.10: Let (X, m_x) have property I. Then the intersection of any two m-h sets is a m-h set.

4. COMPARISON

Theorem 4.1: Any m-open set is an m-A set.

Proof: $S = X \cap S$ where $X \in m\text{-RC}(X)$ and S is m-open. The proof is completed.

Remark 4.2: The converse of Theorem 4.1 is not true. Refer Example 3.3, $\{b, c\}$ is m-A set but not m-open.

Theorem 4.3: Any m-closed set is a m-t set.

Proof: Since $A = m\text{-Cl}(A)$, $m\text{-Int}(A) = m\text{-Int}(m\text{-Cl}(A))$. The proof is completed.

Remark 4.4: The converse of Theorem 4.3 is not true. Refer Example 3.3, $\{a\}$ is m-t set but not m-Closed.

Theorem 4.5: A regular m-open set is a m-t set.

Proof: Since $S = m\text{-Int}(m\text{-Cl}(S))$, $m\text{-Int}(S) = m\text{-Int}(m\text{-Cl}(S))$. The proof is completed.

Remark 4.6: The converse of Theorem 4.5 is not true. Refer Example 3.3. $\{c\}$ is a m-t set but not regular m-open.

Theorem 4.7: Let (X, m_x) have property \mathfrak{B} . Then every regular m-open set is m-open.

Proof: Suppose $S = m\text{-Int}(m\text{-Cl}(S))$. Then $m\text{-Int}(S) = m\text{-Int}(m\text{-Cl}(S))$ and we have $S = m\text{-Int}(S)$. Thus, S is m-open.

Remark 4.8: The converse of Theorem 4.7 is not true. Refer Example 3.3, $\{a, b\}$ is m-open but not regular m-open.

Theorem 4.9: Any m-t set is m-B set.

Proof: $S = X \cap S$ where X is m-open and S is m-t set. The proof is completed.

Remark 4.10: The converse of Theorem 4.9 is not true. Refer Example 3.4, $\{a\}$ is a m-B set but not m-t set.

Theorem 4.11: Any m-open set is a m-B set.

Proof: Since $S = X \cap S$ where S is m-open and X is regular m-open, by Theorem 4.5, X is m-t set. The proof is completed.

Remark 4.12: The converse of Theorem 4.11 is not true. Refer Example 3.3, $\{c\}$ is m-B set but not m-open.

Theorem 4.13: A m-closed set is a m-B set.

Proof: It follows from Theorem 4.3 and Theorem 4.9.

Theorem 4.14: Let (X, m_x) have property \mathfrak{B} . Then every m-A set is a m-B set.

Proof: $S = X \cap S$ where X is m-open and S is regular m-closed. Since S is m-closed, by Theorem 4.3, S is m-t set. The proof is completed.

Remark 4.15: The converse of Theorem 4.14 is not true. Refer Example 3.3, $\{c\}$ is m-B set but not m-A set.

Theorem 4.16: Any m-t set is m-h set.

Proof: Since $m\text{-Int}(S) = m\text{-Int}(m\text{-Cl}(S))$, $m\text{-Cl}(m\text{-Int}(S)) = m\text{-Cl}(m\text{-Int}(m\text{-Cl}(S)))$ implies $m\text{-Int}(m\text{-Cl}(m\text{-Int}(S))) = m\text{-Int}(m\text{-Cl}(S)) = m\text{-Int}(S)$. The proof is completed.

Remark 4.17: The converse of Theorem 4.16 is not true. Refer Example 3.5, $\{b\}$ is m-h set but not m-t set.

Theorem 4.18: Any m-h set is m-C set.

Proof: $S = X \cap S$ where X is m-open and S is m-h set. The proof is completed.

Remark 4.19: The converse of Theorem 4.18 is not true. Refer Example 3.4, $\{a\}$ is m-C set but not m-h set.

Theorem 4.20: Any m-open set is m-C set.

Proof: $S = X \cap S$ where X is m-h set and S is m-open. The proof is completed.

Remark 4.21: The converse of Theorem 4.20 is not true. Refer Example 3.3, $\{c\}$ is m-C set but not m-open.

Theorem 4.22: m-B set is m-C set.

Proof: $S = X \cap S$ where X is m-open and S is m-t set. By Theorem 4.16, S is m-h set. The proof is completed.

Remark 4.23: The converse of Theorem 4.22 is not true. Refer Example 3.5, $\{b\}$ is m-C set but not m-B set.

Remark 4.24: A m-A set need not be m-semi-open as shown in the following example.

Let $X = \{a, b, c\}$ and $m_x = \{\emptyset, X, \{a\}, \{b\}, \{a, b\}, \{b, c\}, \{a, c\}\}$. Then the sets in $\{\emptyset, X, \{a\}, \{b\}, \{c\}, \{a, c\}, \{b, c\}\}$ are called m-closed. We have $\{c\}$ is m-A set but not m-semi-open.

Remark 4.25: A m-semi-open set need not be m-A set as shown in the following example.

Let $X = \{a, b, c\}$ and $m_x = \{\emptyset, X, \{a\}\}$. Then the sets in $\{\emptyset, X, \{b, c\}\}$ are called m-closed. We have $\{a, b\}$ is m-semi-open but not m-A set.

Remark 4.26: By the previous Theorems, Examples and Remarks, we obtain the following diagram:

Here (1) = m-C set, (2) = m-B set, (3) = m-open set,
 (4) = m- α -open set, (5) = m-A set, (6) = m-semi-open set,
 (7) = m-h set, (8) = m-t set, (9) = regular m-open set,
 (10) = m-preopen set.

5. DECOMPOSITIONS OF M-CONTINUITY

Definition 5.1:

(i) Let $f: X \rightarrow Y$ be a mapping where X has property \mathfrak{B} . Then f is said to be M -continuous [8] if $f^{-1}(V)$ is m_x -open in X for every m_y -open set V in Y .

(ii) Let $f: X \rightarrow Y$ be a mapping. Then f is said to be M - α -continuous [9] if $f^{-1}(V)$ is m - α -open in X for every m_y -open set V in Y .

We introduce a new class of mappings as follows.

Definition 5.2: Let $f: X \rightarrow Y$ be a mapping. Then f is said to be

(i) M -A continuous if $f^{-1}(V)$ is M -A set in X for every m_y -open set V in Y .

(ii) M -B continuous if $f^{-1}(V)$ is M -B set in X for every m_y -open set V in Y .

(iii) M -C continuous if $f^{-1}(V)$ is m -C set in X for every m_y -open set V in Y .

Theorem 5.3: Let (X, m_x) have property \mathfrak{B} . Then a subset S of X is regular m -open if and only if it is both m -preopen and m -t set.

Proof: Let S be a regular m -open. By Theorem 4.5, S is m -t set. Also by Theorem 4.7, S is m -open. Thus, S is m -preopen.

Conversely, let S be both m -preopen and m -t set. Since $m\text{-Int}(S) \subseteq S \subseteq m\text{-Int}(m\text{-Cl}(S)) = m\text{-Int}(S)$, $S = m\text{-Int}(m\text{-Cl}(S))$. Hence, S is regular m -open.

Theorem 5.4: Let (X, m_x) have property \mathfrak{B} and property I. Then a subset S of X is m -open if and only if it is both m - α -open and m -A set.

Proof: Let S be an m -open. Then S is m - α -open and by Theorem 4.1, S is m -A set.

Conversely, let S be both m - α -open and m -A set. Since S is m -A set, $S = M \cap N$ where M is m -open and $N \in m\text{-RC}(X)$. Since S is m - α -open.

$$\begin{aligned} M \cap N &\subset m\text{-Int}(m\text{-Cl}(m\text{-Int}(M \cap N))) \subset m\text{-Int}(m\text{-Cl}(m\text{-Int}(M) \cap m\text{-Int}(N))) \\ &= m\text{-Int}(m\text{-Cl}(M \cap m\text{-Int}(N))) \text{ as } M \text{ is } m\text{-open} \subset m\text{-Int}(m\text{-Cl}(M) \cap m\text{-Cl}(m\text{-Int}(N))) \\ &= m\text{-Int}(m\text{-Cl}(M) \cap N) \text{ as } N \in m\text{-RC}(X) \subset m\text{-Int}(m\text{-Cl}(M)) \cap m\text{-Int}(N) \dots (1) \end{aligned}$$

Now since $M \subset m\text{-Int}(m\text{-Cl}(M))$, by (1)

$$\begin{aligned} S &= M \cap N = (M \cap N) \cap M \subset (m\text{-Int}(m\text{-Cl}(M)) \cap m\text{-Int}(N)) \cap M \\ &= M \cap m\text{-Int}(N) \\ &= m\text{-Int}(M \cap N) \text{ by property I} \\ &= m\text{-Int}(S) \end{aligned}$$

Therefore, $S \subset m\text{-Int}(S)$. But $m\text{-Int}(S) \subset S$. Hence, S is m -open.

Theorem 5.5: Let (X, m_x) have property \mathfrak{B} and property I. Then a subset S of X is m -open if and only if it is both m - α -open and m -B set.

Proof: Let S be an m -open. Then S is m - α -open. Also, by Theorem 4.11, S is m -B set.

Conversely, let S be both m - α -open and m -B set. Since S is m -B set, $S = X \cap S$ where X is m -open and S is m -t set.

Then $S = X \cap S \subset X \cap m\text{-Int}(m\text{-Cl}(S))$ (as S is m -preopen) $= X \cap m\text{-Int}(S)$ (as S is m -t set). We have $S \subset X \cap m\text{-Int}(S)$. Hence $S \subset m\text{-Int}(X \cap S)$ by property I and $S \subset m\text{-Int}(S)$. But always $m\text{-Int}(S) \subset S$. Thus $S = m\text{-Int}(S)$ and by property \mathfrak{B} , S is m -open.

Theorem 5.6: Let (X, m_x) have property \mathfrak{B} and property I. Then a subset S of X is m -open if and only if it is both m - α -open and m -C set.

Proof: Let S be an m -open in X . Then S is m - α -open and by Theorem 4.20, S is m -C set.

Conversely, let S be both m - α -open and m -C set. Since S is m -C set, $S = M \cap N$ where M is m -open and N is m -h set. Since S is m - α -open set, $S \subset m\text{-Int}(m\text{-Cl}(m\text{-Int}(S))) = m\text{-Int}(m\text{-Cl}(m\text{-Int}(M))) \cap m\text{-Int}(m\text{-Cl}(m\text{-Int}(N))) = m\text{-Int}(m\text{-Cl}(M)) \cap m\text{-Int}(N)$ (as M is m -open and N is m -h set). Now $S = M \cap N = M \cap (M \cap N) = M \cap S \subset M \cap (m\text{-Int}(m\text{-Cl}(M)) \cap m\text{-Int}(N)) = M \cap m\text{-Int}(N)$ (as $M \subset m\text{-Int}(m\text{-Cl}(M)) = m\text{-Int}(M \cap N)$ (by property I) $= m\text{-Int}(S)$). Thus, $S \subset m\text{-Int}(S)$ and $m\text{-Int}(S) \subset S$. Hence, by property \mathfrak{B} , S is m -open.

Theorem 5.7: Let (X, m_x) have property \mathfrak{B} and property I and $f : X \rightarrow Y$ be a mapping. Then f is M -continuous if and only if

- (i) it is M - α -continuous and M -A continuous.
- (ii) it is M - α -continuous and M -B continuous.
- (iii) it is M - α -continuous and M -C continuous.

Proof: It is the decompositions of M -continuity from Theorems 5.4, 5.5 and 5.6.

Remark 5. 8: In the above four theorems, both properties are used and so the above four theorems are nothing but topological results.
