ABSTRACT

In this paper we introduce a new class of functions called  $\delta\hat{g}$ -closed maps. We obtain several characterizations and some their properties. We also investigate its relationship with other types of functions. Further we introduce and study a new class of functions namely weaker forms of  $\delta\hat{g}$ -closed maps.

**Keywords and Phrases:**  $\delta\hat{g}$ -closed sets,  $\delta\hat{g}$ -continuous,  $\delta\hat{g}$ -closed maps,  $\delta\hat{g}$ -regular,  $\alpha\hat{g}$ -closed sets.

**AMS subject classification:** 54C05, 54C10

1. INTRODUCTION:

Malghan [7] introduced generalised closed functions and Devi et al.[1] introduced  $\alpha\hat{g}$ -closed functions. T. Noiri [9] and Veerakumar[12] introduced  $\delta$ -closed functions and  $\hat{g}$ -closed functions in topological spaces. In this present paper we use  $\delta\hat{g}$ -closed sets to define a new class of functions called  $\delta\hat{g}$ -closed functions and obtain some properties of these functions. We further introduce and study a new class of functions namely weakly  $\delta\hat{g}$ -closed functions and we introduce a new space called  $\delta\hat{g}$ -regular space.

2. PRELIMINARIES:

Throughout this paper  $(X, \tau)$  and  $(Y, \sigma)$  and  $(Z, \eta)$  represent non-empty topological spaces on which no separation axioms are assumed unless or otherwise mentioned. For a subset A of X,  $cl(A)$ ,  $int(A)$  and  $A^c$  denote the closure of A, the interior of A and the complement of A respectively. Let us recall the following definitions, which are useful in the sequel.

**Definition: 2.1** A subset A of a space  $(X, \tau)$  is called a

- (i) semi-open set [3] if  $A \subseteq cl(int(A))$ .
- (ii)  $\alpha$ -open set [8] if  $A \subseteq int(cl(int(A)))$ .
- (iii) regular open set [11] if  $A = int(cl(A))$ .
- (iv)  $\delta$ -open set [13] if  $A = \delta int(A)$ .

The complement of a semi-open (resp.  $\alpha$ -open, regular open) set is called semi-closed (resp.  $\alpha$ -closed, regular closed).

The  $\delta$ -interior [13] of a subset A of X is the union of all regular open set of X contained in A and is denoted by  $Int_{\delta}(A)$ . The subset A is called  $\delta$ -open [13] if  $A = Int_{\delta}(A)$ , i.e. a set is  $\delta$ -open if it is the union of regular open sets. the complement of a  $\delta$ -open is called  $\delta$ -closed. Alternatively, a set  $A \subseteq (X, \tau)$  is called  $\delta$ -closed [13] if  $A = cl_{\delta}(A)$ , where  $cl_{\delta}(A) = \{ x \in X : int(cl(U)) \cap A = \emptyset, U \in \tau \text{ and } x \in U \}$ .

- Definition: 2.2** A subset A of  $(X, \tau)$  is called
- (i) generalized closed (briefly  $g$ -closed) set [4] if  $cl(A) \subseteq U$  whenever  $A \subseteq U$  and U is open set in  $(X, \tau)$ .
  - (ii)  $\delta$ -generalized closed (briefly  $\delta g$ -closed) set [2] if  $cl_{\delta}(A) \subseteq U$  whenever  $A \subseteq U$  and U is open set in  $(X, \tau)$ .
  - (iii)  $\hat{g}$ -closed set [12] if  $cl(A) \subseteq U$  whenever  $A \subseteq U$  and U is a semi-open set in  $(X, \tau)$ .
  - (iv)  $\alpha$ - $\hat{g}$ -closed (briefly  $\alpha\hat{g}$ -closed) set [6] if  $\alpha cl(A) \subseteq U$  whenever  $A \subseteq U$  and U is a  $\hat{g}$ -open set in  $(X, \tau)$ .
  - (v)  $\delta\hat{g}$ -closed set [5] if  $cl_{\delta}(A) \subseteq U$  whenever  $A \subseteq U$  and U is a  $\hat{g}$ -open in  $(X, \tau)$ .

The complement of a  $g$ -closed (resp.  $\delta g$ -closed,  $\hat{g}$ -closed,  $\alpha\hat{g}$ -closed and  $\delta\hat{g}$ -closed) set is called  $g$ -open (resp.  $\delta g$ -open,  $\hat{g}$ -open,  $\alpha\hat{g}$ -open and  $\delta\hat{g}$ -open).

**Definition: 2.3** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called:

- (i)  $\delta$ -closed [9] if  $f(V)$  is  $\delta$ -closed in  $(Y, \sigma)$  for every  $\delta$ -closed set V of  $(X, \tau)$ .
- (ii)  $\delta$ -continuous [10] if  $f^{-1}(V)$  is  $\delta$ -open in  $(X, \tau)$  for every  $\delta$ -open set V of  $(Y, \sigma)$ .
- (iii)  $\delta\hat{g}$ -continuous [5] if  $f^{-1}(V)$  is  $\delta\hat{g}$ -closed in  $(X, \tau)$  for every closed set V of  $(Y, \sigma)$ .
- (iv)  $\delta\hat{g}$ -irresolute [5] if  $f^{-1}(V)$  is  $\delta\hat{g}$ -closed in  $(X, \tau)$

\*Corresponding author: \*\*B. Meera Devi  
E-mail: [abmeeradevi@gmail.com](mailto:abmeeradevi@gmail.com)

for every  $\delta\hat{g}$  closed set  $V$  of  $(Y, \sigma)$ .

(v) generalized closed (briefly  $g$ -closed) (resp.  $g$ -open) [7] if the image of every closed (resp. Open) set in  $(X, \tau)$  is  $g$ -closed (resp.  $g$ -open) in  $(Y, \sigma)$ .

(vi)  $\hat{g}$ -open [12] if  $f(V)$  is  $\hat{g}$ -open in  $(Y, \sigma)$  for every open set  $V$  of  $(X, \tau)$ .

(vii)  $\alpha\hat{g}$ -closed [6] if the image of every closed set in  $(X, \tau)$  is  $\alpha\hat{g}$ -closed in  $(Y, \sigma)$ .

### 3. $\delta\hat{g}$ -CLOSED MAPS:

We introduce the following definitions:

**Definition: 3.1** A map  $f : (X, \tau) \rightarrow (Y, \sigma)$  is called  $\delta\hat{g}$ -closed (resp.  $\delta\hat{g}$ -open) if the image of each closed (resp. Open) set in  $(X, \tau)$  is  $\delta\hat{g}$ -closed (resp.  $\delta\hat{g}$ -open) in  $(Y, \sigma)$ .

**Remark: 3.2**  $\delta\hat{g}$ -openness and  $\delta\hat{g}$ -continuity are independent as shown by the following examples.

**Example: 3.3** Let  $X = \{a, b, c\} = Y$ ;  $\tau = \{\emptyset, \{a\}, \{c\}, \{a, c\}, \{b, c\}, X\}$  and,  $\sigma = \{\emptyset, \{b\}, Y\}$ . Define  $f : (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = b, f(b) = c$  and  $f(c) = a$ . Then  $f$  is  $\delta\hat{g}$ -continuous but not  $\delta\hat{g}$ -open, because  $\{b, c\}$  is open in  $(X, \tau)$  but  $f(\{b, c\}) = \{a, c\}$  is not  $\delta\hat{g}$ -open in  $(Y, \sigma)$ .

**Example: 3.4** Let  $X = \{a, b, c\} = Y$  with topologies  $\tau = \{\emptyset, \{a\}, \{b, c\}, X\}$  and,  $\sigma = \{\emptyset, \{a\}, Y\}$ . Define  $f : (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = b, f(b) = a$  and  $f(c) = c$ . Then  $f$  is  $\delta\hat{g}$ -open but not  $\delta\hat{g}$ -continuous, because  $\{b, c\}$  is closed in  $(X, \tau)$  but  $f^{-1}(\{b, c\}) = \{a, c\}$  is not  $\delta\hat{g}$ -closed in  $(X, \tau)$ .

**Remark: 3.5** The composite mapping of two  $\delta\hat{g}$ -closed maps is not in  $\delta\hat{g}$ -closed maps as shown in following example.

**Example: 3.6** Let  $X = \{a, b, c\} = Y = Z$ ;  $\tau = \{\emptyset, \{a\}, \{c\}, \{a, c\}, X\}$ ,  $\sigma = \{\emptyset, \{a\}, Y\}$  and  $\eta = \{\emptyset, \{a\}, \{a, b\}, \{a, c\}, Z\}$ . Define a map  $f : (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = a, f(b) = c$  and  $f(c) = b$  and let  $g : (Y, \sigma) \rightarrow (Z, \eta)$  be the identity function. Clearly  $f$  and  $g$  are  $\delta\hat{g}$ -closed maps. But  $g \circ f : (X, \tau) \rightarrow (Z, \eta)$  is not an  $\delta\hat{g}$ -closed map because  $(g \circ f)(\{b\}) = \{c\}$  is not an  $\delta\hat{g}$ -closed set of  $(Z, \eta)$  where  $\{b\}$  is a closed set of  $(X, \tau)$ .

**Theorem: 3.7** If  $f : (X, \tau) \rightarrow (Y, \sigma)$  is closed and  $g : (Y, \sigma) \rightarrow (Z, \eta)$  is  $\delta\hat{g}$ -closed map then  $g \circ f : (X, \tau) \rightarrow (Z, \eta)$  is  $\delta\hat{g}$ -closed.

**Proof:** Let  $G$  be a closed subset of  $X$ . Since  $f$  is closed,  $f(G)$  is closed set of  $Y$ . On the other hand,  $\delta\hat{g}$ -closeness of  $g$  implies  $g(f(G))$  is  $\delta\hat{g}$ -closed in  $Z$ . Hence  $g \circ f : (X, \tau) \rightarrow (Z, \eta)$  is  $\delta\hat{g}$ -closed map.

**Remark: 3.8.** If  $f : (X, \tau) \rightarrow (Y, \sigma)$  is  $\delta\hat{g}$ -closed and  $g : (Y, \sigma) \rightarrow (Z, \eta)$  is closed map then  $g \circ f : (X, \tau) \rightarrow (Z, \eta)$  may not be  $\delta\hat{g}$ -closed. In an example 3.6,  $f$  is  $\delta\hat{g}$ -closed and  $g$  is closed but  $g \circ f$  is not  $\delta\hat{g}$ -closed map.

**Definition: 3.9.** A map  $f : (X, \tau) \rightarrow (Y, \sigma)$  is called  $\delta g$ -closed. (resp.  $\delta g$ -open) if the image of each closed (resp. open) set in  $(X, \tau)$  is  $\delta g$ -closed in  $(Y, \sigma)$

**Theorem 3.10.** Every  $\delta\hat{g}$ -closed map is  $\delta g$ -closed.

**Proof:** It is true that every  $\delta\hat{g}$ -closed set is  $\delta g$ -closed.

**Remark: 3.11.** The converse of theorem 3.10 need not be true as shown in the following example.

**Example: 3.12.** Let  $X = \{a, b, c\} = Y$  with topologies  $\tau = \{\emptyset, \{b, c\}, X\}$  and  $\sigma = \{\emptyset, \{c\}, \{a, b\}, Y\}$ . Define a function  $f : (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = b, f(b) = a, f(c) = c$ . Then  $f$  is not  $\delta\hat{g}$ -closed map because  $\{a\}$  is closed in  $(X, \tau)$  but  $f(\{a\}) = \{b\}$  is not  $\delta\hat{g}$ -closed in  $(Y, \sigma)$ . However  $f$  is  $\delta g$ -closed.

**Theorem: 3.13.** Every  $\delta\hat{g}$ -closed map is  $\alpha\hat{g}$ -closed.

**Proof:** It is true that every  $\delta\hat{g}$ -closed set is  $\alpha\hat{g}$ -closed.

**Remark: 3.14.** The converse of Theorem 3.13 need not be true as shown in the following example.

**Example: 3.15.** Let  $X = \{a, b, c\} = Y$  with topologies  $\tau = \{\emptyset, \{b\}, \{b, c\}, X\}$  and  $\sigma = \{\emptyset, \{b\}, \{a, b\}, \{b, c\}, Y\}$ . Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  be a function defined by  $f(a) = c, f(b) = b$  and  $f(c) = a$ . Then  $f$  is not  $\delta\hat{g}$ -closed map because  $\{a\}$  is closed in  $(X, \tau)$  but  $f(\{a\}) = \{c\}$  is not  $\delta\hat{g}$ -closed in  $(Y, \sigma)$ . However  $f$  is  $\alpha\hat{g}$ -closed.

**Theorem: 3.16.** Every  $\delta\hat{g}$ -closed map is  $g$ -closed.

**Proof:** It is true that every  $\delta\hat{g}$ -closed set is  $g$ -closed.

**Remark: 3.17.** The converse of the above theorem need not be true as shown in the following example.

**Example: 3.18.** Let  $X = \{a, b, c\} = Y$  with topologies  $\tau = \{\emptyset, \{b\}, \{a, c\}, X\}$  and  $\sigma = \{\emptyset, \{a\}, \{a, b\}, \{a, c\}, Y\}$ . Define a map  $f : (X, \tau) \rightarrow (Y, \sigma)$  be a function defined by  $f(a) = c, f(b) = c$  and  $f(c) = b$ . Then  $f$  is  $\delta\hat{g}$ -closed map. However it is not  $\delta\hat{g}$ -closed because  $\{b\}$  is closed in  $(X, \tau)$  but  $f(\{b\}) = \{c\}$  is not  $\delta\hat{g}$ -closed in  $(Y, \sigma)$ .

**Remark: 3.19** The following examples show that  $\delta\hat{g}$ -closeness and  $\hat{g}$ -closeness are independent notions.

**Example: 3.20.** Let  $X = \{a, b, c\} = Y$  with topologies  $\tau = \{\emptyset, \{a\}, \{a, b\}, X\}$  and  $\sigma = \{\emptyset, \{a\}, Y\}$ . Define a function  $f : (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = a, f(b) = c$  and  $f(c) = b$ . Then  $f$  is  $\delta\hat{g}$ -closed map but not  $\hat{g}$ -closed because  $f(\{c\}) = \{b\}$  is not  $\hat{g}$ -closed in  $(Y, \sigma)$  where  $\{c\}$  is closed set in  $(X, \tau)$ .

**Example: 3.21.** Let  $X = \{a, b, c\} = Y$  with topologies  $\tau = \{\emptyset, \{a\}, \{a, b\}, X\}$  and  $\sigma = \{\emptyset, \{a\}, \{b, c\}, Y\}$ . Define a function  $f : (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = a, f(b) = c$  and  $f(c) = b$ . Then  $f$  is  $\hat{g}$ -closed map. However  $f$  is not  $\delta\hat{g}$ -closed because  $\{c\}$  is not closed in  $(X, \tau)$  but  $f(\{c\}) = \{b\}$  is not  $\delta\hat{g}$ -closed in  $(Y, \sigma)$ .

**Remark: 3.22.** The following table shows the relationships of  $\delta\hat{g}$ -closed maps with other known existing maps. The symbol "I" in a cell means that a map implies the other maps. Finally the symbol "O" means that a map not implies the other maps.

TABLE- 1

closed functions	$\delta\hat{g}$	$\delta g$	$g$	$\alpha\hat{g}$	$\hat{g}$
$\delta\hat{g}$	1	1	1	1	0
$\delta g$	0	1	1	0	0
$\sigma$	0	0	1	0	0
$\alpha\hat{g}$	0	0	0	1	0
$\hat{g}$	0	0	1	0	1

**Theorem: 3.23.** A map  $f:(X, \tau) \rightarrow (Y, \sigma)$  is  $\delta\hat{g}$ -closed if and only if for each subset  $G$  of  $(Y, \sigma)$  and for each open set  $U$  of  $(X, \tau)$  containing  $f^{-1}(G)$ , there exists an  $\delta\hat{g}$ -open set  $B$  of  $(Y, \sigma)$  such that  $G \subset B$  and  $f^{-1}(B) \subset U$ .

**Proof:** Let  $f$  be an  $\delta\hat{g}$ -closed map and let  $G$  be an subset of  $(Y, \sigma)$  and  $U$  be an open set of  $(X, \tau)$  containing  $f^{-1}(G)$ . Then  $X-U$  is closed in  $(X, \tau)$ . Since  $f$  is  $\delta\hat{g}$ -closed map,  $f(X-U)$  is  $\delta\hat{g}$ -closed set in  $(Y, \sigma)$ . Hence  $Y-f(X-U)$  is  $\delta\hat{g}$ -open set in  $(Y, \sigma)$ . Take  $V = Y-f(X-U)$ . Then  $V$  is  $\delta\hat{g}$ -open set in  $(Y, \sigma)$  containing  $G$ . Such that  $f^{-1}(V) \subset U$ . Conversely, let  $F$  be an closed subset of  $(X, \tau)$ . Then  $f^{-1}(Y-f(F)) \subset X-F$  and  $X-F$  is open. By hypothesis there is an  $\delta\hat{g}$ -open set  $V$  of  $(Y, \sigma)$  such that  $Y-f(F) \subset V$  and  $f^{-1}(V) \subset X-F$ . Therefore,  $F \subset X-f^{-1}(V)$ . Hence  $Y-V \subset f(F) \subset f(X-f^{-1}(V)) \subset Y-V$  which implies  $f(F) = Y-V$  and hence  $f(F)$  is  $\delta\hat{g}$ -closed in  $(Y, \sigma)$ . Thus  $f$  is an  $\delta\hat{g}$ -closed map.

**Theorem: 3.24.** Let  $f:(X, \tau) \rightarrow (Y, \sigma)$  and  $g:(Y, \sigma) \rightarrow (Z, \eta)$  be any two maps:

- (i) If  $g \circ f : (X, \tau) \rightarrow (Z, \eta)$  is  $\delta\hat{g}$ -closed map and  $g$  is  $\delta\hat{g}$ -irresolute injective map then  $f$  is  $\delta\hat{g}$ -closed
- (ii) If  $g \circ f : (X, \tau) \rightarrow (Z, \eta)$  is  $\delta\hat{g}$ -irresolute and  $g$  is  $\delta\hat{g}$ -closed injective map then  $f$  is  $\delta\hat{g}$ -continuous.

**Proof:** (i) Let  $U$  be closed in  $(X, \tau)$ . Since  $g \circ f$  is  $\delta\hat{g}$ -closed,  $(g \circ f)(U)$  is  $\delta\hat{g}$ -closed in  $(Z, \eta)$ . Therefore  $g(f(U))$  is  $\delta\hat{g}$ -closed in  $(Z, \eta)$ . Since  $g$  is irresolute,  $g^{-1}(g(f(U)))$  is  $\delta\hat{g}$ -closed in  $(Y, \sigma)$ . That is  $f(U)$  is  $\delta\hat{g}$ -closed in  $(Y, \sigma)$ . Hence  $f$  is  $\delta\hat{g}$ -closed.  
 (ii) Let  $U$  be closed in  $(Y, \sigma)$ . Since  $g$  is  $\delta\hat{g}$ -closed,  $g(U)$  is  $\delta\hat{g}$ -closed in  $(Z, \eta)$ . Since  $g \circ f$  is  $\delta\hat{g}$ -irresolute,  $(g \circ f)^{-1}(g(U))$  is  $\delta\hat{g}$ -closed in  $(X, \tau)$ .

Therefore,  $(f^{-1} \circ g^{-1})g(U)$  is  $\delta\hat{g}$ -closed in  $(X, \tau)$ . Hence  $f^{-1}(U)$  is  $\delta\hat{g}$ -closed in  $(X, \tau)$ . This shows that  $f$  is  $\delta\hat{g}$ -continuous.

**Theorem: 3.25.** Let  $f:(X, \tau) \rightarrow (Y, \sigma)$  and  $g:(Y, \sigma) \rightarrow$

$(Z, \eta)$  be any two maps and  $g \circ f : (X, \tau) \rightarrow (Z, \eta)$  be an  $\delta\hat{g}$ -closed map. If  $f$  is continuous then  $g$  is  $\delta\hat{g}$ -closed.

**Proof:** Let  $V$  be closed in  $(Y, \sigma)$ . Since  $f$  is continuous,  $f^{-1}(V)$  is closed in  $(X, \tau)$ . Since  $g \circ f$  is  $\delta\hat{g}$ -closed,  $(g \circ f)(f^{-1}(V))$  is  $\delta\hat{g}$ -closed in  $(Z, \eta)$ . That is  $g(V)$  is  $\delta\hat{g}$ -closed in  $(Z, \eta)$ . Hence  $g$  is  $\delta\hat{g}$ -closed.

**Theorem: 3.26.** A bijection  $f:(X, \tau) \rightarrow (Y, \sigma)$  is  $\delta\hat{g}$ -closed map iff  $f(U)$  is  $\delta\hat{g}$ -open in  $(Y, \sigma)$  for every open set  $U$  in  $(X, \tau)$ .

**Proof:** Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  be an  $\delta\hat{g}$ -closed map and  $U$  be an open set in  $(X, \tau)$ . Then  $U^c$  is closed in  $(X, \tau)$ . Since  $f$  is  $\delta\hat{g}$ -closed map,  $f(U^c)$  is  $\delta\hat{g}$ -closed set in  $(Y, \sigma)$ . But  $f(U^c) = [f(U)]^c$  and hence  $[f(U)]^c$  is  $\delta\hat{g}$ -closed in  $(Y, \sigma)$ . Hence  $f(U)$  is  $\delta\hat{g}$ -open in  $(Y, \sigma)$ . Conversely,  $f(U)$  is  $\delta\hat{g}$ -open in  $(Y, \sigma)$  for every open set  $U$  of  $(X, \tau)$  then  $U^c$  is closed set in  $(X, \tau)$  and  $[f(U)]^c$  is  $\delta\hat{g}$ -closed in  $(Y, \sigma)$ . But  $[f(U)]^c = f(U^c)$  and hence  $f(U^c)$  is  $\delta\hat{g}$ -closed in  $(Y, \sigma)$ . Therefore,  $f$  is  $\delta\hat{g}$ -closed map.

#### 4.WEAKLY $\delta\hat{g}$ -CLOSED MAPS

We introduce the following definition:

**Definition: 4.1** A map  $f:(X, \tau) \rightarrow (Y, \sigma)$  is called weakly  $\delta\hat{g}$ -closed (resp. weakly  $\delta\hat{g}$ -open) if the image of every  $\delta$ -closed (resp.  $\delta$ -open) set in  $(X, \tau)$  is  $\delta\hat{g}$ -closed (resp.  $\delta\hat{g}$ -open) set in  $(Y, \sigma)$ .

**Theorem: 4.2** Every  $\delta\hat{g}$ -closed map is weakly  $\delta\hat{g}$ -closed.

**Proof:** Let  $f:(X, \tau) \rightarrow (Y, \sigma)$  be an  $\delta\hat{g}$ -closed map and  $G$  be a  $\delta$ -closed set in  $(X, \tau)$ . Every  $\delta$ -closed set is closed,  $G$  is closed set in  $(X, \tau)$ . Since  $f$  is  $\delta\hat{g}$ -closed,  $f(G)$  is  $\delta\hat{g}$ -closed in  $(Y, \sigma)$ . Hence  $f$  is weakly  $\delta\hat{g}$ -closed map.

**Remark: 4.3.** The converse of the above theorem need not be true as shown in the following example.

**Example:4.4.** Let  $X = \{a, b, c\} = Y$ ;  $\tau = \{\emptyset, \{a\}, \{b\}, \{a, b\}, \{a, c\}, X\}$ ,  $\sigma = \{\emptyset, \{b\}, \{a, c\}, Y\}$ . Let  $f:(X, \tau) \rightarrow (Y, \sigma)$  be the identity map. Then  $f$  is weakly  $\delta\hat{g}$ -Closed map but  $f$  is not  $\delta\hat{g}$ -closed. Since  $f(\{b, c\}) = \{b, c\}$  is not  $\delta\hat{g}$ -closed in  $(Y, \sigma)$  where  $\{b, c\}$  is closed in  $(X, \tau)$ .

**Theorem: 4.5** Every  $\delta$ -closed map is weakly  $\delta\hat{g}$ -closed map

**Proof:** It is true that every  $\delta$ -closed set is  $\delta\hat{g}$ -closed.

**Remark: 4.6** The converse of the above theorem need not be true as shown in the following example.

**Example: 4.7** Let  $X = \{a, b, c\} = Y$ ;  $\tau = \{\emptyset, \{a\}, \{b\}, \{a, b\}, \{a, c\}, X\}$ ,  $\sigma = \{\emptyset, \{a\}, Y\}$ . Let  $f:(X, \tau) \rightarrow (Y, \sigma)$  be the identity map. Then  $f$  is weakly  $\delta\hat{g}$ -closed map but  $f$  is not  $\delta$ -closed map because  $f(\{a, c\}) = \{a, c\}$  is not  $\delta$ -

closed in  $(Y, \sigma)$  where  $\{a, c\}$  is closed in  $(X, \tau)$ .

**Proposition: 4.8.** The composite mapping of weakly  $\delta\hat{g}$ -closed maps need not be weakly  $\delta\hat{g}$ -closed as shown in the following example.

**Example 4.9.** Let  $X = \{a, b, c\} = Y = Z$  with topologies  $\tau = \{\emptyset, \{a\}, \{b\}, \{a, b\}, \{a, c\}, X\}$  and  $\sigma = \{\emptyset, \{b\}, \{c\}, \{a, b\}, \{b, c\}, Y\}$ ,  $\eta = \{\emptyset, \{c\}, \{a, b\}, Z\}$ . Define a function  $f : (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = a$ ,  $f(b) = a$  and  $f(c) = b$  and let  $g : (Y, \sigma) \rightarrow (Z, \eta)$  be the identity function. Clearly  $f$  and  $g$  are weakly  $\delta\hat{g}$ -closed map but the  $g \circ f : (X, \tau) \rightarrow (Z, \eta)$  is not an weakly  $\delta\hat{g}$ -closed map because  $\{b\}$  is  $\delta$ -closed in  $(X, \tau)$  but  $(g \circ f)(\{b\}) = g(f(\{b\})) = \{a\}$  is not  $\delta\hat{g}$ -closed set in  $(Z, \eta)$ .

**Theorem : 4.10** Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  and  $g : (Y, \sigma) \rightarrow (Z, \eta)$  be any two maps. Then

- (i)  $g \circ f : (X, \tau) \rightarrow (Z, \eta)$  is weakly  $\delta\hat{g}$ -closed map, if  $f$  is  $\delta$ -closed map and  $g$  is weakly  $\delta\hat{g}$ -closed map.
- (ii) If  $g \circ f : (X, \tau) \rightarrow (Z, \eta)$  is weakly  $\delta\hat{g}$ -closed and  $g$  is  $\delta\hat{g}$ -irresolute injective map then  $f$  is weakly  $\delta\hat{g}$ -closed.

**Proof:** (i) Let  $V$  be  $\delta$ -closed in  $(X, \tau)$ . Since  $f$  is  $\delta$ -closed map,  $f(V)$  is  $\delta$ -closed in  $(Y, \sigma)$ . Since  $g$  is weakly  $\delta\hat{g}$ -closed map,  $g(f(V))$  is  $\delta\hat{g}$ -closed in  $(Z, \eta)$ . That is  $(g \circ f)(V)$  is  $\delta\hat{g}$ -closed in  $(Z, \eta)$ . Hence  $(g \circ f)$  is weakly  $\delta\hat{g}$ -closed map.

(ii) Let  $U$  be the  $\delta$ -closed in  $(X, \tau)$ . Since  $g \circ f$  is weakly  $\delta\hat{g}$ -closed map,  $(g \circ f)(U)$  is  $\delta\hat{g}$ -closed in  $(Z, \eta)$ . Therefore  $g(f(U))$  is  $\delta\hat{g}$ -closed in  $(Z, \eta)$ . Since  $g$  is  $\delta\hat{g}$ -irresolute,  $g^{-1}(g(f(U)))$  is  $\delta\hat{g}$ -closed in  $(Y, \sigma)$ . That is  $f(U)$  is  $\delta\hat{g}$ -closed in  $(Y, \sigma)$ . Hence  $f$  is weakly  $\delta\hat{g}$ -closed map.

**Remark: 4.11** Weakly  $\delta\hat{g}$ -closeness and  $\delta\hat{g}$ -irresoluteness are independent notions as shown in the following example.

**Example: 4.12** Let  $X = \{a, b, c\} = Y$  with topologies  $\tau = \{\emptyset, \{a, b\}, X\}$ ,  $\sigma = \{\emptyset, \{b\}, Y\}$ . Define a function  $f : (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = b$ ,  $f(b) = c$  and  $f(c) = a$ . Then  $f$  is weakly  $\delta\hat{g}$ -closed map but not  $\delta\hat{g}$ -irresolute because  $f^{-1}(\{b, c\}) = \{a, b\}$  is not  $\delta\hat{g}$ -closed in  $(X, \tau)$  where  $\{b, c\}$  is  $\delta\hat{g}$ -closed in  $(Y, \sigma)$ .

**Example: 4.13.** Let  $X = \{a, b, c\} = Y$  with topologies  $\tau = \{\emptyset, \{a\}, \{c\}, \{a, c\}, X\}$ ,  $\sigma = \{\emptyset, \{a\}, \{c\}, \{a, b\}, \{a, c\}, Y\}$ . Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  be an identity function. Clearly  $f$  is  $\delta\hat{g}$ -irresolute but not weakly  $\delta\hat{g}$ -closed map because  $f(\{c\}) = \{c\}$  is not  $\delta\hat{g}$ -closed in  $(Y, \sigma)$  where  $\{c\}$  is  $\delta$ -closed in  $(X, \tau)$ .

**Theorem: 4.14.** A bijection  $f : (X, \tau) \rightarrow (Y, \sigma)$  is weakly  $\delta\hat{g}$ -closed map, iff  $f(U)$  is  $\delta\hat{g}$ -open in  $(Y, \sigma)$  for every  $\delta$ -open set  $U$  in  $(X, \tau)$ .

**Proof:** Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  is weakly  $\delta\hat{g}$ -closed map and  $U$  be an  $\delta$ -open set in  $(X, \tau)$ . Then  $U^c$  is  $\delta$ -closed set in  $(X, \tau)$ . Since  $f$  is weakly  $\delta\hat{g}$ -closed map,  $f(U^c)$  is  $\delta\hat{g}$ -closed set in  $(Y, \sigma)$ . But  $f(U^c) = [f(U)]^c$  and

hence  $[f(U)]^c$  is  $\delta\hat{g}$ -closed set in  $(Y, \sigma)$ . Hence  $f(U)$  is  $\delta\hat{g}$ -open in  $(Y, \sigma)$ . Conversely,  $f(U)$  is  $\delta\hat{g}$ -open in  $(Y, \sigma)$  for every  $\delta$ -open set  $U$  of  $(X, \tau)$ . Then  $U^c$  is  $\delta$ -closed set in  $(X, \tau)$  and  $[f(U)]^c$  is  $\delta\hat{g}$ -closed in  $(Y, \sigma)$ . Hence  $f(U^c)$  is  $\delta\hat{g}$ -closed in  $(Y, \sigma)$ . Thus  $f$  is weakly  $\delta\hat{g}$ -closed map.

**Theorem: 4.15.** A map  $f : (X, \tau) \rightarrow (Y, \sigma)$  is weakly  $\delta\hat{g}$ -closed map, iff for each subset  $B$  of  $(Y, \sigma)$  and for each  $\delta$ -open set  $U$  of  $(X, \tau)$  containing  $f^{-1}(B)$ , there exists an  $\delta\hat{g}$ -open set  $V$  of  $(Y, \sigma)$  such that  $B \subset V$  and  $f^{-1}(V) \subset U$ .

**Proof:** Necessity, suppose  $f$  is weakly  $\delta\hat{g}$ -closed map. Let  $B$  be any subset of  $(Y, \sigma)$  and  $U$  be an  $\delta$ -open set of  $(X, \tau)$  containing  $f^{-1}(B)$ . Then  $X - U$  is  $\delta$ -closed subset of  $(X, \tau)$ . Since  $f$  is weakly  $\delta\hat{g}$ -closed map,  $f(X - U)$  is  $\delta\hat{g}$ -closed set in  $(Y, \sigma)$ . That is  $Y - f(X - U)$  is  $\delta\hat{g}$ -open in  $(Y, \sigma)$ . Put  $V = Y - f(X - U)$ . Then  $V$  is an  $\delta\hat{g}$ -open set in  $(Y, \sigma)$  containing  $B$  such that  $f^{-1}(V) \subset U$ . Sufficiency. Let  $F$  be any  $\delta$ -closed subset of  $(X, \tau)$ . Then  $f^{-1}(Y - f(F)) \subset X - F$  and  $X - F$  is  $\delta$ -open in  $(X, \tau)$ . Put  $B = Y - f(F)$ . Then  $f^{-1}(B) \subset X - F$ . There exists an  $\delta\hat{g}$ -open set  $V$  of  $(Y, \sigma)$  such that  $B = Y - f(F) \subset V$  and  $f^{-1}(V) \subset X - F$ . Therefore we obtain  $f(F) = Y - V$  and hence  $f(F)$  is  $\delta\hat{g}$ -closed in  $(Y, \sigma)$ . Thus  $f$  is weakly  $\delta\hat{g}$ -closed map.

## 5. APPLICATIONS:

**Definition: 5.1.** [5] A space  $(X, \tau)$  is called  $\hat{T}_{3/4}$ -space if every  $\delta\hat{g}$ -Closed set in it is  $\delta$ -closed.

**Theorem: 5.2.** Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  and  $g : (Y, \sigma) \rightarrow (Z, \eta)$  two functions. Let  $(Y, \sigma)$  be  $\hat{T}_{3/4}$  spaces. Then

- (i)  $g \circ f : (X, \tau) \rightarrow (Z, \eta)$  is  $\delta\hat{g}$ -closed map if  $g$  is  $\delta\hat{g}$ -closed and  $f$  is  $\delta\hat{g}$ -closed map.
- (ii)  $g \circ f : (X, \tau) \rightarrow (Z, \eta)$  is weakly  $\delta\hat{g}$ -closed map if  $g$  is weakly  $\delta\hat{g}$ -closed and  $f$  is weakly  $\delta\hat{g}$ -closed.

**Proof:** (i) Let  $V$  be closed in  $(X, \tau)$ . Since  $f$  is  $\delta\hat{g}$ -closed map,  $f(V)$  is  $\delta\hat{g}$ -closed set in  $(Y, \sigma)$ . Since  $Y$  is  $\hat{T}_{3/4}$  space,  $f(V)$  is  $\delta$ -closed in  $Y$ . Since  $g$  is  $\delta\hat{g}$ -closed map,  $g(f(V))$  in  $(Z, \eta)$ . That is  $(g \circ f)(V)$  is  $\delta\hat{g}$ -closed in  $(Z, \eta)$ . Hence  $(g \circ f)$  is  $\delta\hat{g}$ -closed map.

(ii) Let  $U$  be the  $\delta$ -closed in  $(X, \tau)$ . Since  $f$  is weakly  $\delta\hat{g}$ -closed map,  $f(U)$  is  $\delta\hat{g}$ -closed in  $(Y, \sigma)$ . since  $Y$  is  $\hat{T}_{3/4}$  space,  $f(U)$  is  $\delta$ -closed in  $(Y, \sigma)$ . Since  $g$  is weakly  $\delta\hat{g}$ -closed,  $g(f(U))$  is  $\delta\hat{g}$ -closed in  $(Z, \eta)$ . That is  $g \circ f(U)$  is  $\delta\hat{g}$ -closed in  $(Z, \eta)$ . Hence  $g \circ f$  is weakly  $\delta\hat{g}$ -closed map.

We introduce the following definition:

**Definition: 5.3.** A space  $(X, \tau)$  is said to be  $\delta\hat{g}$ -regular if for each closed set  $F$  of  $X$  and each point  $x \notin F$  there exists disjoint  $\delta\hat{g}$ -open sets  $U$  and  $V$  such that  $F \subset U$  and  $x \in V$ .

**Theorem: 5.4.** In a topological space  $(X, \tau)$ , the

following statements are equiv- alent.

- (i)  $(X, \tau)$  is  $\delta\hat{g}$ -regular.
- (ii) For every point of  $(X, \tau)$  and every open set  $V$  containing  $x$  there exists an  $\delta\hat{g}$ -open set  $A$  such that  $x \in A \subset \text{cl}_\delta(A) \subset V$ .

**Proof:** (i)  $\Rightarrow$  (ii) Let  $x \in X$  and  $V$  be an open set containing  $x$ . Then  $X-V$  is closed and  $x \notin X-V$ . By (i) there exists an  $\delta\hat{g}$ -open set  $A$  and  $B$  such that  $x \in A$  and  $X-V \subset B$ . That is  $X-B \subset V$ . Since every open set is  $\hat{g}$ -open,  $V$  is  $\hat{g}$ -open.  $X-B$  is  $\delta\hat{g}$ -closed. Therefore  $\text{cl}_\delta(X-B) \subset V$ . Since  $A \cap B = \emptyset$ ,  $A \subset X-B$ . Hence  $x \in A \subset \text{cl}_\delta(A) \subset \text{cl}_\delta(X-B) \subset V$ . Thus  $x \in A \subset \text{cl}_\delta(A) \subset V$ . (ii)  $\Rightarrow$  (i) Let  $F$  be a closed set and  $x \notin F$ . This implies that  $X-F$  is open set containing  $x$ . By (ii), there exists an  $\delta\hat{g}$ -open set  $A$  such that  $x \in A \subset \text{cl}_\delta(A) \subset X-F$ . That is  $F \subset X-\text{cl}_\delta(A)$ . Since every closed set is  $\delta\hat{g}$ -closed,  $\text{cl}_\delta(A)$  is  $\delta\hat{g}$ -closed and  $X-\text{cl}_\delta(A)$  is  $\delta\hat{g}$ -open. Therefore,  $A$  and  $X-\text{cl}_\delta(A)$  are the required  $\delta\hat{g}$ -open sets.

**Theorem: 5.5.** Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  is a continuous and  $\delta\hat{g}$ -closed, bijection map and  $(X, \tau)$  is a regular space then  $(Y, \sigma)$  is  $\delta\hat{g}$ -regular.

**Proof:** let  $y \in Y$  and  $B$  be an open set containing  $y$  of  $(Y, \sigma)$  Let  $x$  be a point of  $(X, \tau)$  such that  $y = f(x)$ . Since  $f$  is continuous,  $f^{-1}(B)$  is open in  $(X, \tau)$ . since  $(X, \tau)$  is regular, there exists an open set  $U$  such that  $x \in U \subset \text{cl}(U) \subset f^{-1}(B)$ . Hence  $y = f(x) \in f(U) \subset f(\text{cl}(U)) \subset V$ . Since  $f$  is an  $\delta\hat{g}$ -closed map,  $f(\text{cl}(U))$  is an  $\delta\hat{g}$ -closed set Contained in the open set  $V$ , which is  $\hat{g}$ -open. Hence we have  $\text{cl}_\delta(f(\text{cl}(U))) \subset V$ . Therefore  $y \in f(U) \subset \text{cl}_\delta(f(U)) \subset \text{cl}_\delta(f(\text{cl}(U))) \subset V$ . This implies  $y \in f(U) \subset \text{cl}_\delta(f(U)) \subset V$ . Since  $f$  is  $\delta\hat{g}$ -closed map,  $U^c$  is closed in  $X$ ,  $f(U^c)$  is  $\delta\hat{g}$ -closed in  $(Y, \sigma)$ . But  $f(U^c) = [f(U)]^c$  is  $\delta\hat{g}$ -closed in  $(Y, \sigma)$ . Hence  $f(U)$  is  $\delta\hat{g}$ -open in  $(Y, \sigma)$ . Thus for every point  $y$  of  $(Y, \sigma)$  and every open set  $V$  containing  $y$  there exists an  $\delta\hat{g}$ -open set  $f(U)$  such that

$$y \in f(U) \subset \text{cl}_\delta(f(U)) \subset V.$$

Hence by the above theorem,  $(Y, \sigma)$  is  $\delta\hat{g}$ -regular.

**Theorem: 5.6.** If  $f:(X, \tau) \rightarrow (Y, \sigma)$  is a continuous and weakly  $\delta\hat{g}$ -closed bijective map and if  $(X, \tau)$  is  $\hat{T}_{3/4}$ -space and regular space then  $(Y, \sigma)$  is  $\delta\hat{g}$ -regular

**Proof:** let  $y \in (Y, \sigma)$  and  $V$  be an open set containing  $y$ . Let  $x$  be a point of  $(X, \tau)$ , such that  $y = f(x)$ . Since  $f$  is continuous,  $f^{-1}(V)$  is open in  $(X, \tau)$ . By assumptions and theorem 5.3, there exists an  $\delta\hat{g}$ -open set  $U$  such that  $x \in U \subset \text{cl}_\delta(U) \subset f^{-1}(V)$ . Then

$$y \in f(U) \subset f(\text{cl}_\delta(U)) \subset V$$

We know that

$\text{cl}_\delta(U)$  is  $\delta$ -closed. Since  $f$  is weakly  $\delta\hat{g}$ -closed,  $f(\text{cl}_\delta(U))$  is  $\delta\hat{g}$ -closed set in  $(Y, \sigma)$ . Every open set is  $\hat{g}$ -open

and hence  $V$  is  $\hat{g}$ -open. Therefore we get  $\text{cl}_\delta(f(\text{cl}_\delta(U))) \subset V$ . This implies  $y \in f(U) \subset \text{cl}_\delta(f(U)) \subset \text{cl}_\delta(f(\text{cl}_\delta(U))) \subset V$ . That is  $y \in f(U) \subset \text{cl}_\delta(f(U)) \subset V$ . Now  $U$  is  $\delta\hat{g}$ -open implies  $U^c$  is  $\delta\hat{g}$ -closed in  $(X, \tau)$ . Since  $(X, \tau)$  is  $\hat{T}_{3/4}$  and  $f$  is weakly  $\delta\hat{g}$ -closed map  $f(U^c)$  is  $\delta\hat{g}$ -closed in  $(Y, \sigma)$ . But  $f(U^c) = [f(U)]^c$ . That is  $[f(U)]^c$  is  $\delta\hat{g}$ -closed in  $(Y, \sigma)$ . This implies  $f(U)$  is  $\delta\hat{g}$ -open in  $(Y, \sigma)$ . Thus for every point  $y$  of  $(Y, \sigma)$  and every open set  $V$  containing  $y$ , there exists an  $\delta\hat{g}$ -open set  $f(U)$  such that  $y \in f(U) \subset \text{cl}_\delta(f(U)) \subset V$ . Hence by theorem 5.3,  $(Y, \sigma)$  is  $\delta\hat{g}$ -regular.
