ABSTRACT

In this paper we introduce a new class of sets  $(i, j) - g^{*\alpha}$  - closed sets in bitopological spaces. Properties of these sets are investigated and we introduce new bitopological spaces  $(i, j) - T_{1/2}^{*\alpha}$  and  $(i, j) - {}^{*\alpha}T_{1/2}$  as applications.

**Key words:**  $(i, j)$ - $g$ -closed sets,  $(i, j)$ - $g^*$ -closed sets,  $(i, j) - g^{*\alpha}$  - closed sets;  $(i, j) - T_{1/2}^{*\alpha}$  spaces, and  $(i, j) - {}^{*\alpha}T_{1/2}$  space.

1. INTRODUCTION

A triple  $(X, \tau_1, \tau_2)$  where  $X$  is non-empty set and  $\tau_1$  and  $\tau_2$  are topologies on  $X$  is called a bitopological space and Kelly [10] initiated the study of such spaces. In 1985, Fukutake introduced the concepts of  $g$ -closed sets [8] in bitopological spaces. Recently Veera Kumar introduced and studied the concepts of  $g^*$  -closed set [19] and  $g^*$  -continuity in topological spaces.

The purpose of this paper is to introduce the new class of sets, namely  $g^{*\alpha}$  - closed sets. Applying these sets, the author introduced the new class of spaces, namely  $(i, j) - T_{1/2}^{*\alpha}$  spaces,  $(i, j) - {}^{*\alpha}T_{1/2}$  spaces for bitopological spaces and investigate some of their properties. In this paper we study the relationship of  $g^{*\alpha}$  - closed sets with the class of closed sets namely  $(i, j)$ - $g^*$ -closed[17],  $(i, j)$ - $gs$ -closed[5],  $(i, j)$ - $\alpha g$ -closed [14],  $(i, j)$ - $gsp$ -closed[5],  $(i, j)$ - $rg$ -closed set[16],  $(i, j)$ - $sg$ -closed[6], and  $(i, j)$ - $gpr$ -closed sets. Also we study the relationship of  $(i, j) - T_{1/2}^{*\alpha}$ ,  $(i, j) - {}^{*\alpha}T_{1/2}$  spaces with  $(i, j) - T_{1/2}$  [7],  $(i, j) - T_{1/2}^*$  [17],  $(i, j) - T_b$  spaces.

2. PRELIMINARIES

If  $A$  is a subset of  $X$  with a topology  $\tau$ , then the closure of  $A$  is denoted by  $\tau\text{-cl}(A)$  or  $\text{cl}(A)$ , the interior of  $A$  is denoted by  $\tau\text{-int}(A)$ , or  $\text{int}(A)$  and the complement of  $A$  in  $X$  is denoted by  $A^c$ .

**Definitions 2.1:** A subset  $A$  of a bitopological space  $(X, \tau_1, \tau_2)$  is called

- (i) a generalized open ( $g$ -open) set[17] if  $F \subseteq \text{int}(A)$  whenever  $F \subseteq A$  and  $F$  is closed in  $(X, \tau)$ .
- (ii) a  $\alpha$ -open set[15] if  $A \subseteq \text{int}(\text{cl}(\text{int}(A)))$ .
- (iii) a regular closed set[16] if  $A = \text{cl}(\text{int}(A))$ .
- (iv) a semi-open set[12] if  $A \subseteq \text{cl}(\text{int}(A))$ .
- (v) a semi-pre-open set[1] if  $\text{cl}(\text{int}(\text{cl}(A))) \subseteq A$ .
- (vi) a preclosed set[17] if  $A = \text{int}(\text{cl}(A))$ .

**Definition 2.2:** A subset  $A$  of a bitopological space  $(X, \tau_1, \tau_2)$  is called

- (i)  $(i, j)$ - $g^*$ -closed[17] if  $\tau_j\text{-cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U \in \text{GO}(X, \tau)$
- (ii)  $(i, j)$ - $gs$ -closed[5] if  $\tau_j\text{-scl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $\tau_i$ .
- (iii)  $(i, j)$ - $\alpha g$ -closed [14] if  $\tau_j\text{-}\alpha\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U \in \tau_i$ .
- (iv)  $(i, j)$ - $gsp$ -closed[5] if  $\tau_j\text{-spcl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $\tau_i$ .
- (v)  $(i, j)$ - $rg$ -closed set[16] if  $\tau_j\text{-cl}(A) \subseteq U$  whenever  $A \subseteq U$  is and  $U$  is regular open in  $\tau_i$ .
- (vi)  $(i, j)$ - $sg$ -closed[7] if  $\tau_j\text{-scl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is semi open in  $\tau_i$ .
- (vii)  $(i, j)$ - $gpr$ -closed[9] if  $\tau_j\text{-pcl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is regular open in  $\tau_i$ .

The family of all (i, j)-g-closed (resp (i, j)-gsp-closed, (i, j)-gp-closed, (i, j)-gpr-closed, (i, j)- $\alpha$ gr-closed, (i, j)- $\alpha$ g-closed, (i, j)-gs-closed) subsets of a bitopological space  $(X, \tau_1, \tau_2)$  is denoted by  $D(i, j)$ .

**Definition 2.3:** (i) A bitopological space  $(X, \tau_1, \tau_2)$  is said to be an (i, j) -  $T_{1/2}^*$  space if every (i, j)- $g^*$ -closed set is  $\tau_j$ -closed.

(ii) A bitopological space  $(X, \tau_1, \tau_2)$  is said to be an (i, j)- $T_b$  space if every (i, j)-gs-closed set is  $\tau_j$ -closed.

### 3. (i, j) - $g^{*\alpha}$ - CLOSED SETS

In this section we introduce the concept of (i, j) -  $g^{*\alpha}$ - closed sets in bitopological spaces.

**Definition 3.1:** A subset A of a bitopological space  $(X, \tau_1, \tau_2)$  is said to be an (i, j) -  $g^{*\alpha}$ - closed set if  $\tau_j - \alpha \text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U \in \text{GO}(X, \tau_i)$ .

We denote the family of all (i, j) -  $g^{*\alpha}$ - closed sets in  $(X, \tau_1, \tau_2)$  by  $D^{*\alpha}(i, j)$ .

**Remark 3.2:** By setting  $\tau_1 = \tau_2$ , in Definition 3.1, a (i, j) -  $g^{*\alpha}$ - closed set is a  $g^*$ - closed set.

If A is (i)  $\tau_j$ -closed, (ii)  $\tau_j$ - $\alpha$ -closed, (iii) (i, j) -  $g^*$ - closed subset of  $(X, \tau_1, \tau_2)$ , then A is (i,j)-  $g^{*\alpha}$ - closed.

The following examples show that the reverse implications of the above proposition are not true.

**Example 3.4:** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{a\}, X\}$ ,  $\tau_2 = \{\phi, \{a\}, \{a, b\}, X\}$ . Then the subset  $A = \{b\}$  is (1, 2) -  $g^{*\alpha}$ -closed but not  $\tau_2$ - closed in  $(X, \tau_1, \tau_2)$ .

**Example 3.5:** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{a\}, \{b\}, \{a, b\}, X\}$ ,  $\tau_2 = \{\phi, \{a\}, X\}$ . Then the subset  $\{a, c\}$  is  $g^{*\alpha}$ -closed but not  $\tau_2$ - $\alpha$ -closed.

**Example 3.6:** let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{a\}, X\}$ ;  $\tau_2 = \{\phi, \{a\}, \{a, b\}, X\}$ . The subset  $\{b\}$  is (1, 2) -  $g^{*\alpha}$ -closed but not (1, 2)- $g^*$ -closed.

**Proposition 3.7:** In a bitopological space  $(X, \tau_1, \tau_2)$  every (i, j) -  $g^{*\alpha}$ - closed set is (i) (i, j)-gs-closed, (ii) (i, j)- $\alpha$ g-closed, (iii) (i, j)- $\alpha$ gr-closed, (iv) (i, j)-gsp-closed.

The following examples support that the converse of the above theorem is not true.

**Example 3.8:** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{a\}, X\}$ ,  $\tau_2 = \{\phi, \{a\}, \{a, b\}, X\}$ . In this example, the subsets  $\{a, b\}$ ,  $\{a, c\}$  are (1, 2) - gs-closed but not (1, 2) -  $g^{*\alpha}$ -closed.

**Example 3.9:** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{c\}, \{a, b\}, X\}$ ,  $\tau_2 = \{\phi, \{a\}, X\}$ . The subset  $\{a, c\}$  is (1, 2)-  $\alpha$ g-closed but not (1, 2) -  $g^{*\alpha}$ -closed.

**Example 3.10:** let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{a\}, X\}$ ;  $\tau_2 = \{\phi, \{a\}, \{b, c\}, X\}$ . The subsets  $\{b\}$ ,  $\{c\}$ ,  $\{a, b\}$ ,  $\{a, c\}$  are (1, 2) -  $\alpha$ gr-closed but not (1, 2) -  $g^{*\alpha}$ -closed.

**Example 3.11:** let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{a\}, X\}$ ;  $\tau_2 = \{\phi, \{a\}, \{a, b\}, X\}$ . The subsets  $\{a, b\}$ ,  $\{a, c\}$  are (1, 2)- gsp-closed sets but not (1, 2) -  $g^{*\alpha}$ -closed.

**Proposition 3.12:** In a bitopological space  $(X, \tau_1, \tau_2)$  every (i, j) -  $g^{*\alpha}$ - closed set is (i) (i, j)-gpr-closed, (ii) (i, j)-gp-closed, (iii) (i, j)-pre-semi-closed.

The following examples support that the reverse implications of the above propositions are not true.

**Example 3.13:** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{a, b\}, X\}$ ,  $\tau_2 = \{\phi, \{c\}, X\}$ . Then the subsets  $\{a, c\}$ ,  $\{b, c\}$  are (1,2)-gpr-closed but not (1, 2) -  $g^{*\alpha}$ -closed.

**Example 3.14:** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{a, b\}, X\}$ ,  $\tau_2 = \{\phi, \{b\}, \{a, c\}, X\}$ . Then the subsets  $\{a\}$ ,  $\{c\}$ ,  $\{a, b\}$ ,  $\{b, c\}$  are (1, 2)-gp-closed but not (1, 2) -  $g^{*\alpha}$ -closed.

**Example 3.15:** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{a, b\}, X\}$ ,  $\tau_2 = \{\phi, \{b\}, \{a, c\}, X\}$ . Then the subsets  $\{a\}$ ,  $\{c\}$ ,  $\{a, b\}$ ,  $\{b, c\}$  are (1, 2)-pre semi-closed but not (1, 2) -  $g^{*\alpha}$ -closed.

**Proposition 3.29:** If A is  $(i, j)$ - $g^{*\alpha}$ -closed set, then  $\tau_j$ - $\alpha\text{cl}(A) - A$  contains no non-empty  $\tau_i$ - $g$ -closed set.

**Proof:** Let A be  $(i, j)$ - $g^{*\alpha}$ -closed set and F be a  $\tau_j$ - $g$ -closed set such that  $F \subseteq \tau_j\text{-}\alpha\text{cl}(A) - A$  then  $F^c \supset A$ , And  $F^c$  is  $g$ -open. We have  $\tau_j\text{-}\alpha\text{cl}(A) \subseteq F^c$ . Thus  $F \subseteq \tau_j\text{-}\alpha\text{cl}(A) \cap (\tau_j\text{-}\alpha\text{cl}(A))^c = \phi$

**Corollary 3.30:** If A is  $(i, j)$ - $g^{*\alpha}$ -closed in  $(X, \tau_1, \tau_2)$ , then A is  $\tau_j$ - $\alpha$ -closed if and only if  $\tau_j\text{-}\alpha\text{cl}(A) - A$  is  $\tau_i$ - $g$ -closed.

**Proof: Necessity:** If A is  $\tau_j$ - $\alpha$ -closed then,  $\tau_j\text{-}\alpha\text{cl}(A) = A$ . i.e.,  $\tau_j\text{-}\alpha\text{cl}(A) - A = \phi$  and hence  $\tau_j\text{-}\alpha\text{cl}(A) - A$  is  $\tau_i$ - $g$ -closed.

**Sufficiency:** Suppose  $\tau_j\text{-}\alpha\text{cl}(A) - A = F \neq \phi$ , Then by the proposition 3.29, F contains a  $g$ -closed set B.  $\tau_j\text{-}\alpha\text{cl}(A) - A = \phi$ , since A is  $g^{*\alpha}$ -closed. Therefore A is  $\tau_j$ - $\alpha$ -closed.

**Proposition 3.31:** If A is an  $(i, j)$ - $g^{*\alpha}$ -closed in  $(X, \tau_1, \tau_2)$ , then  $\tau_i$ - $\text{cl}(x) \cap A \neq \phi$  holds for each  $x \in \tau_j\text{-}\alpha\text{cl}(A)$ .

**Proof:** If A is  $(i, j)$ - $g^{*\alpha}$ -closed set. And let  $x \in \tau_j\text{-}\alpha\text{cl}(A)$ . Suppose  $\tau_i\text{-}\text{cl}(x) \cap A = \phi$ . Then,  $A \subseteq (\tau_i\text{-}\text{cl}(x))^c = U$  where U is open in  $\tau_i$ . Thus  $A \subseteq U$  where U is  $g$ -open in  $\tau_i$ . Then  $\tau_j\text{-}\alpha\text{cl}(A) \subseteq U$ , since A is  $(i, j)$ - $g^{*\alpha}$ -closed. Hence  $\tau_i\text{-}\text{cl}(x) \cap A \neq \phi$ .

**Proposition 3.32:** If A is  $(i, j)$ - $g^{*\alpha}$ -closed set of  $(X, \tau_1, \tau_2)$  such that  $A \subseteq B \subseteq \tau_j\text{-}\alpha\text{cl}(A)$ , then B is also a  $(i, j)$ - $g^{*\alpha}$ -closed set of  $(X, \tau_1, \tau_2)$ .

**Proof:** If A is  $(i, j)$ - $g^{*\alpha}$ -closed of  $(X, \tau_1, \tau_2)$  such that  $A \subseteq B \subseteq \tau_j\text{-}\alpha\text{cl}(A)$ . Let  $B \subseteq U$  where U is  $g$ -open in  $\tau_i$ . Since  $A \subseteq B$ ,  $A \subseteq U$  where U is  $g$ -open in  $\tau_i$ . Then,  $\tau_j\text{-}\alpha\text{cl}(A) \subseteq U$  since A is  $(i, j)$ - $g^{*\alpha}$ -closed. i.e.,  $B \subseteq \tau_j\text{-}\alpha\text{cl}(A) \subseteq U$ . Hence  $\tau_j\text{-}\alpha\text{cl}(B) \subseteq U$ . Therefore B is  $(i, j)$ - $g^{*\alpha}$ -closed set of  $(X, \tau_1, \tau_2)$ .

#### 4. $(i, j)$ - $T_{1/2}^{*\alpha}$ and $(i, j)$ - $^{*\alpha}T_{1/2}$ spaces

In this section, we introduce  $(i, j)$ - $T_{1/2}^{*\alpha}$  and  $(i, j)$ - $^{*\alpha}T_{1/2}$  bitopological spaces.

**Definition 4.1:** A bitopological space  $(X, \tau_1, \tau_2)$  is said to be an  $(i, j)$ - $T_{1/2}^{*\alpha}$  space if every  $(i, j)$ - $g^{*\alpha}$ -closed set is  $\tau_j$ -closed.

**Proposition 4.2:** If  $(X, \tau_1, \tau_2)$  is said to be an  $(i, j)$ - $T_{1/2}^{*\alpha}$  space. Then it is an  $(i, j)$ - $T_{1/2}^*$  space but not conversely.

**Example 4.3:** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{a\}, X\}$ ,  $\tau_2 = \{\phi, \{a\}, \{a, b\}, X\}$ . Then  $(X, \tau_1, \tau_2)$  is  $(1, 2)$ - $T_{1/2}^{*\alpha}$  space, since the subsets  $\{b\}, \{c\}, \{b, c\}$  are  $(1, 2)$ - $g^*$ -closed and  $\tau_2$ -closed, but  $(X, \tau_1, \tau_2)$  is not  $(1, 2)$ - $T_{1/2}^{*\alpha}$ , since the subset  $\{b\}$  is  $(1, 2)$ - $g^{*\alpha}$ -closed but not  $\tau_2$ -closed.

**Proposition 4.4:** Every  $(i, j)$ - $T_b$ -space is  $(i, j)$ - $T_{1/2}^{*\alpha}$  space but not conversely.

**Example 4.5:** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{a\}, X\}$ ,  $\tau_2 = \{\phi, \{a\}, \{b, c\}, X\}$ . Then the space  $(X, \tau_1, \tau_2)$  is  $(1, 2)$ - $T_{1/2}^{*\alpha}$  space since the subsets  $\{a\}, \{b, c\}$  are  $(1, 2)$ - $g^{*\alpha}$ -closed and  $\tau_2$ -closed but  $(X, \tau_1, \tau_2)$  is not  $(1, 2)$ - $T_b$ , since the subsets  $\{b\}, \{c\}, \{a, b\}, \{a, c\}$  are  $(1, 2)$ - $g$ -closed but not  $\tau_2$ -closed.

**Definition 4.12:** A bitopological space  $(X, \tau_1, \tau_2)$  is said to be an  $(i, j)$ - $^{*\alpha}T_{1/2}$  space if every  $(i, j)$ - $g^{*\alpha}$ -closed set is  $(i, j)$ - $g^*$ -closed.

**Proposition 4.13:** Every  $(i, j)$ - $T_{1/2}^{*\alpha}$  space is  $(i, j)$ - $^{*\alpha}T_{1/2}$  but not conversely.

**Example 4.14:** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{c\}, \{a, c\}, X\}$ ,  $\tau_2 = \{\phi, \{a\}, X\}$ . Then  $(X, \tau_1, \tau_2)$  is an  $(1, 2)$ - $^{*\alpha}T_{1/2}$  space, since the subsets  $\{b\}, \{c\}, \{a, b\}, \{b, c\}$  are  $(1, 2)$ - $g^{*\alpha}$ -closed and  $g^*$ -closed but not an  $(1, 2)$ - $T_{1/2}^{*\alpha}$ -space, since the subset  $\{b\}$  is  $(1, 2)$ - $g^{*\alpha}$ -closed but not  $\tau_2$ -closed.

**Proposition 4.15:** Every  $(i, j)$ - $T_b$ -space is  $(i, j)$ - $^{*\alpha}T_{1/2}$  space but not conversely.

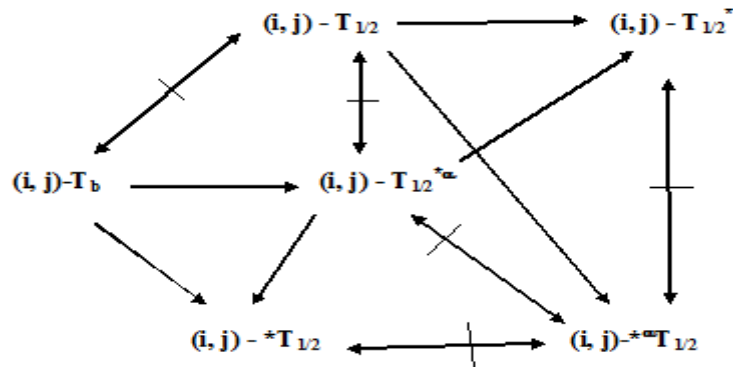

**Example 4.16:** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{c\}, \{a, c\}, X\}$ ,  $\tau_2 = \{\phi, \{a\}, X\}$ . Then  $(X, \tau_1, \tau_2)$  is an  $(1, 2)$ - $^{*\alpha}T_{1/2}$  space, since the subsets  $\{b\}, \{c\}, \{a, b\}, \{b, c\}$  are  $(1, 2)$ - $g^{*\alpha}$ -closed and  $g^*$ -closed but not an  $(1, 2)$ - $T_b$ -space, since the subsets  $\{b\}, \{c\}, \{a, b\}$  are  $(1, 2)$ - $g$ -closed and not  $\tau_2$ -closed.

**Proposition 4.17:**  $(i, j) - T_{1/2}^{*\alpha}$  and  $(i, j) - {}^{*\alpha}T_{1/2}$  are independent as seen from the following two examples.

**Example 4.18:** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\emptyset, \{c\}, \{a, c\}, X\}$ ,  $\tau_2 = \{\emptyset, \{a\}, X\}$ . Then  $(X, \tau_1, \tau_2)$  is an  $(1, 2) - {}^{*\alpha}T_{1/2}$  space since the subsets  $\{b\}$ ,  $\{c\}$ ,  $\{a, b\}$ ,  $\{b, c\}$  are  $(1, 2) - g^{*\alpha}$ -closed and  $g^*$ -closed but not an  $(1, 2) - T^*$ -space, since the subsets  $\{b\}$ ,  $\{c\}$ ,  $\{a, b\}$  are  $(1, 2) - g^*$ -closed and not  $\tau_2$ -closed.

**Example 4.19:** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\emptyset, \{a\}, X\}$ ,  $\tau_2 = \{\emptyset, \{a\}, \{a, b\}, X\}$ . Then  $(X, \tau_1, \tau_2)$  is  $(1, 2) - T^*_{1/2}$  - space since the subsets  $\{c\}$ ,  $\{b, c\}$  are  $(1, 2) - g^*$ -closed and  $\tau_2$ -closed but not an  $(1, 2) - {}^{*\alpha}T_{1/2}$  space, since the subset  $\{b\}$  is  $(1, 2) - g^{*\alpha}$ -closed and not  $\tau_2$ -closed.

All the above results can be represented by the following diagram.

Where  $A \rightarrow B$  (resp.  $A \not\rightarrow B$ ) represents  $A$  implies  $B$  but not conversely (resp.  $A$  and  $B$  are independent)
