ABSTRACT

In this paper, a new class of sets, namely (1, 2)\*- $M_{\delta\pi}$ -closed sets is introduced in bitopological spaces. We prove that this class lies between the class of (1, 2)\*- $\delta$ -closed sets and the class of (1, 2)\*- $\delta g$ -closed sets. Also we discuss some basic properties and applications of (1, 2)\*- $M_{\delta\pi}$ -closed sets, which defines a new class of space namely (1, 2)\*- $T_{\delta\pi g}$ -space.

**Keywords:** (1, 2)\*- $\pi g$ -closed set, (1, 2)\*- $\delta$ -closed set, (1, 2)\*- $M_{\delta\pi}$ -closed set, (1, 2)\*- $T_{\delta\pi g}$ -space.

**2000 mathematics subject classification:** 54E55, 54C55.

1. INTRODUCTION

Njastad[9], Velicko[10] introduced the concept of  $\alpha$ -open sets and  $\delta$ -closed sets respectively. Dontchev and Ganster [3] studied  $\delta$ -generalized closed set in topological spaces. Levine[5] introduced generalization of closed sets and discussed their properties. Also M. E. Abd El-Monsef [1] et al investigated  $\alpha$ -closed sets in topological spaces. Thivagar et al [5] have developed the concepts of (1, 2)\*-semi-open sets, (1, 2)\*- $\alpha$ -open sets, (1, 2)\*-generalised closed sets, (1, 2)\*-semi generalised closed sets and (1, 2)\*- $\alpha$ -generalized closed sets in bitopological spaces. Recently Arockiarani and Mohana [2] discussed (1, 2)\*- $\pi g\alpha$ -closed sets in bitopological spaces. The purpose of the present paper is to define a new class of closed sets called (1, 2)\*-  $M_{\delta\pi}$ -closed sets and we discuss some basic properties of (1, 2)\*- $M_{\delta\pi}$ -closed sets in bitopological spaces. Applying these sets, we obtain a new space called (1, 2)\*-  $T_{\delta\pi g}$ -space.

2. PRELIMINARIES

Throughout this paper by a space X and Y represent non-empty bitopological spaces on which no separation axioms are assumed, unless otherwise mentioned. We recall the following definitions and results which are useful in the sequel.

**Definition: 2.1** [5] A subset S of a bitopological space X is said to be  $\tau_{1,2}$ -open if  $S=A \cup B$  where  $A \in \tau_1$  and  $B \in \tau_2$ . A subset S of X is said to be (i)  $\tau_{1,2}$ -closed if the complement of S is  $\tau_{1,2}$ -open. (ii)  $\tau_{1,2}$ -clopen if S is both  $\tau_{1,2}$ -open and  $\tau_{1,2}$ -closed.

**Definition: 2.2** [5] Let S be a subset of the bitopological space X. Then the  $\tau_{1,2}$ -interior of S denoted by  $\tau_{1,2}\text{-int}(S)$  is defined by  $\cup \{G: G \subseteq S \text{ and } G \text{ is } \tau_{1,2}\text{-open}\}$  and the  $\tau_{1,2}$ -closure of S denoted by  $\tau_{1,2}\text{-cl}(S)$  is defined by  $\cap \{F: S \subseteq F \text{ and } F \text{ is } \tau_{1,2}\text{-closed}\}$ .

**Definition: 2.3** A subset A of a bitopological space X is called

- (i) (1, 2)\*-regular open [5] if  $A = \tau_{1,2}\text{-int}(\tau_{1,2}\text{-cl}(A))$ .
- (ii) (1, 2)\*- $\alpha$ -open [5] if  $A \subseteq \tau_{1,2}\text{-int}(\tau_{1,2}\text{-cl}(\tau_{1,2}\text{-int}(A)))$ .
- (iii) (1, 2)\*-semi-open [5] if  $A \subseteq \tau_{1,2}\text{-cl}(\tau_{1,2}\text{-int}(A))$

The complement of the sets mentioned from (i) to (iii) are called their respective closed sets.

**Definition: 2.4** [2] Let S be a subset of the bitopological space X. Then

- (i) The (1, 2)\*- $\alpha$ -interior of S denoted by (1, 2)\*- $\alpha\text{-int}(S)$  is defined by  $\cup \{G: G \subseteq S \text{ and } G \text{ is } (1, 2)^*\text{-}\alpha\text{-open}\}$ .
- (ii) The (1, 2)\*- $\alpha$ -closure of S denoted by (1, 2)\*- $\alpha\text{-cl}(S)$  is defined by  $\cap \{F: S \subseteq F \text{ and } F \text{ is } (1, 2)^*\text{-}\alpha\text{-closed}\}$ .

**Definition: 2. 5** A subset A of a bitopological space X is called

- (i) (1, 2)\*- πgα - closed [2] if (1, 2)\*-αcl (A) ⊆ U whenever A ⊆ U and U is τ<sub>1,2</sub>-π - open.
- (ii) (1, 2)\*-πg- closed [7] if τ<sub>1,2</sub>-cl (A) ⊆ U whenever A ⊆ U and U is τ<sub>1,2</sub>-π-open.
- (iii) (1, 2)\*- strongly- πgα - closed [8] if (1, 2)\*-αcl (A) ⊆ U whenever A ⊆ U and U is (1, 2)\*-πg-open.
- (iv) (1, 2)\*-g- closed [5] if τ<sub>1,2</sub>-cl (A) ⊆ U whenever A ⊆ U and U is τ<sub>1,2</sub>-open.
- (v) (1, 2)\*- gα- closed [5] if (1, 2)\*-αcl (A) ⊆ A whenever A ⊆ U and U is (1, 2)\*-α-open.
- (vi) (1, 2)\*- αg- closed [5] if (1, 2)\*-αcl (A) ⊆ A whenever A ⊆ U and U is τ<sub>1,2</sub>-open.
- (vii) (1, 2)\*- gs- closed [5] if (1, 2)\*-scl (A) ⊆ A whenever A ⊆ U and U is τ<sub>1,2</sub>-open.
- (viii) (1, 2)\*-  $\overset{\wedge}{g}$  - closed [4] if τ<sub>1,2</sub>-cl (A) ⊆ A whenever A ⊆ U and U is (1, 2)\*-semi-open. and the complement of the sets mentioned from (i) to (viii) are called their respective open sets.

**Definition: 2.6 [5]** A space X is called (1, 2)\*-T<sub>1/2</sub>-space if every (1, 2)\*-g-closed set in it is an τ<sub>1,2</sub>-closed.

### 3. (1, 2)\*-M<sub>δπ</sub>-Closed sets

**Definition: 3.1** The (1, 2)\*-δ-interior of a subset A of X is the union of all (1, 2)\*-regular open set of X contained in A and is denoted by (1, 2)\*-δ-int (A). The subset A is called (1, 2)\*-δ-open if A = (1, 2)\*-δ-int (A), (i. e), a set is (1, 2)\*-δ-open if it is the union of (1, 2)\*-regular open sets. The complement of a (1, 2)\*-δ-open set is called (1, 2)\*-δ-closed. Alternatively, a sub set A in X is called (1, 2)\*-δ-closed if A = (1, 2)\*-δ-cl (A), where (1, 2)\*-δ-cl (A) = {x ∈ X: τ<sub>1,2</sub>-int (τ<sub>1,2</sub>-cl (U)) ∩ A ≠ ∅, U ∈ τ<sub>1,2</sub> and x ∈ U}.

**Definition: 3. 2** A subset A of a space X is called (1, 2)\*-M<sub>δπ</sub>-closed set if (1, 2)\*-δcl (A) ⊆ U whenever A ⊆ U and U is (1, 2)\*-πg-open set in X.

**Proposition: 3. 3** Every (1, 2)\*-δ-closed set is (1, 2)\*-M<sub>δπ</sub>-closed set.

**Proof:** Let A be an (1, 2)\*-δ-closed set and U be any (1, 2)\*-πg-open set containing A. Since A is (1, 2)\*-δ-closed, (1, 2)\*-δcl (A) = A, for every subset A of X. Therefore, (1, 2)\*-δcl (A) ⊆ U and hence A is (1, 2)\*-M<sub>δπ</sub>-closed set.

**Remark: 3. 4** The converse of the above theorem is not true as shown in the following example.

**Example: 3. 5** Let X = {a, b, c, d}, τ<sub>1</sub> = {Φ, X, {a}, {d}, {a, d}}, τ<sub>2</sub> = {Φ, X, {a, c}, {c, d}, {a, c, d}}. Here {a, b}, {a, b, d} are (1, 2)\*-M<sub>δπ</sub>-closed set, but not (1, 2)\*-δ-closed set in X.

**Proposition: 3. 6** Every (1, 2)\*-M<sub>δπ</sub>-closed set is (1, 2)\*-πg-closed set.

**Proof:** Let A be an (1, 2)\*-M<sub>δπ</sub>-closed set and U be an any τ<sub>1,2</sub>-π-open set containing A in X. Since every τ<sub>1,2</sub>-π-open set is τ<sub>1,2</sub>-open set and therefore (1, 2)\*-πg-open set. Also A is (1, 2)\*-M<sub>δπ</sub> -closed, (1, 2)\*-δcl (A) ⊆ U, for every subset A of X. Since τ<sub>1,2</sub>-cl (A) ⊆ (1, 2)\*-δcl (A) ⊆ U implies τ<sub>1,2</sub>-cl (A) ⊆ U and hence A is (1, 2)\*-πg-closed set.

**Remark: 3. 7** An (1, 2)\*-πg-closed set need not be (1, 2)\*- M<sub>δπ</sub> -closed set as shown in the following example.

**Example: 3. 8** Let X = {a, b, c, d}, τ<sub>1</sub> = {Φ, X, {a}, {b}, {a, b}}, τ<sub>2</sub> = {Φ, X, {a, b, d}}. Then the sets {c}, {d}, {a, d}, {b, c}, {b, d}, {a, b, c}, {a, b, d} are (1, 2)\*-πg-closed set, but not (1, 2)\*- M<sub>δπ</sub> -closed set in X.

**Proposition: 3. 9** Every (1, 2)\*- M<sub>δπ</sub> -closed set is (1, 2)\*-πgα-closed set.

**Proof:** It is true that (1, 2)\*-αcl (A) ⊆ (1, 2)\*-δcl (A) for every subset A of X.

**Remark: 3. 10** A (1, 2)\*-πgα-closed set need not be (1, 2)\*- M<sub>δπ</sub> -closed set as shown in the following example.

**Example: 3. 11** Let X = {a, b, c, d}, τ<sub>1</sub> = {Φ, X, {a}, {a, b, d}}, τ<sub>2</sub> = {Φ, X, {b}, {a, b}}. Then the set {a, b, c} is (1, 2)\*-πgα-closed set, but not (1, 2)\*- M<sub>δπ</sub> -closed set in X.

**Proposition: 3. 12** Every (1, 2)\*- M<sub>δπ</sub> -closed set is (1, 2)\*-strongly-πgα-closed set.

**Proof:** It is true that (1, 2)\*-αcl (A) ⊆ (1, 2)\*-δcl (A) for every subset A of X.

**Remark: 3. 13** A  $(1, 2)^*$ -strongly- $\pi g\alpha$ -closed set need not be  $(1, 2)^*$ -  $M_{\delta\pi}$  -closed set as shown in the following example.

**Example: 3. 14** Let  $X = \{a, b, c, d\}$ ,  $\tau_1 = \{\Phi, X, \{a\}, \{d\}, \{c, d\}, \{a, d\}, \{a, c, d\}\}$ ,  $\tau_2 = \{\Phi, X, \{a, c\}\}$ . Then the set  $\{b, d\}$  is  $(1, 2)^*$ -strongly- $\pi g\alpha$ -closed set, but not  $(1, 2)^*$ -  $M_{\delta\pi}$  -closed set in  $X$ .

**Definition: 3. 15** A subset  $A$  of a bitopological space  $X$  is called  $(1, 2)^*$ - $\delta g$ - closed if  $(1, 2)^*\text{-}\delta\text{cl}(A) \subseteq A$  whenever  $A \subseteq U$  and  $U$  is  $\tau_{1,2}$ -open.

**Proposition: 3. 16** Every  $(1, 2)^*$ - $M_{\delta\pi}$  -closed set is  $(1, 2)^*$ - $\delta g$ -closed set.

**Proof:** Let  $A$  be an  $(1, 2)^*$ - $M_{\delta\pi}$  -closed set and  $U$  be an any  $\tau_{1,2}$ -open set containing  $A$  in  $X$ . Since every  $\tau_{1,2}$ -open set is  $(1, 2)^*$ - $\pi g$ -open set,  $(1, 2)^*\text{-}\delta\text{cl}(A) \subseteq U$ , whenever  $A \subseteq U$  and  $U$  is  $(1, 2)^*$ - $\pi g$ -open set. Therefore,  $(1, 2)^*\text{-}\delta\text{cl}(A) \subseteq U$  and  $U$  is  $\tau_{1,2}$ -open. Hence  $A$  is  $(1, 2)^*$ - $\delta g$ -closed set.

**Remark: 3. 17** A  $(1, 2)^*$ - $\delta g$ -closed set need not be  $(1, 2)^*$ - $M_{\delta\pi}$  -closed set as shown in the following example.

**Example: 3. 19** Let  $X = \{a, b, c, d\}$ ,  $\tau_1 = \{\Phi, X, \{a\}, \{c\}, \{a, c\}, \{a, b, d\}\}$ ,  $\tau_2 = \{\Phi, X, \{b, c, d\}\}$ . Then the sets  $\{b\}$ ,  $\{d\}$ ,  $\{c, d\}$ ,  $\{a, d\}$ ,  $\{b, c\}$ ,  $\{a, c, d\}$ ,  $\{a, b, c\}$  are  $(1, 2)^*$ - $\delta g$ -closed set, but not  $(1, 2)^*$ - $M_{\delta\pi}$ -closed set in  $X$ .

**Remark: 3. 20** The class of  $(1, 2)^*$ - $M_{\delta\pi}$  -closed sets is properly placed between the classes of  $(1, 2)^*$ - $\delta$ -closed and  $(1, 2)^*$ - $\delta g$ -closed sets.

**Proposition: 3. 21** Every  $(1, 2)^*$ - $M_{\delta\pi}$  -closed set is  $(1, 2)^*$ - $g s$ -closed set.

**Proof:** It is true that  $(1, 2)^*\text{-}s\text{cl}(A) \subseteq (1, 2)^*\text{-}\delta\text{cl}(A) \subseteq U$ ,  $(1, 2)^*\text{-}s\text{cl}(A) \subseteq U$  and hence  $A$  is  $(1, 2)^*$ - $g s$ -closed set.

**Remark: 3. 22** A  $(1, 2)^*$ - $g s$ -closed set need not be  $(1, 2)^*$ - $M_{\delta\pi}$ -closed set as shown in the following example.

**Example: 3. 23** Let  $X = \{a, b, c, d\}$ ,  $\tau_1 = \{\Phi, X, \{a\}, \{a, b, d\}\}$ ,  $\tau_2 = \{\Phi, X, \{c\}, \{a, c\}, \{b, c, d\}\}$ . Then the sets  $\{a\}$ ,  $\{b\}$ ,  $\{d\}$ ,  $\{a, d\}$ ,  $\{c, d\}$ ,  $\{b, c\}$ ,  $\{a, b, c\}$ ,  $\{a, c, d\}$  are  $(1, 2)^*$ - $g s$ -closed set, but not  $(1, 2)^*$ -  $M_{\delta\pi}$  -closed set in  $X$ .

**Proposition: 3. 24** Every  $(1, 2)^*$ -  $M_{\delta\pi}$  -closed set is  $(1, 2)^*$ - $\alpha g$ -closed set.

**Proof:** It is true that,  $(1, 2)^*\text{-}\alpha\text{cl}(A) \subseteq (1, 2)^*\text{-}\delta\text{cl}(A)$  for every subset  $A$  of  $X$ .

**Remark: 3. 25** A  $(1, 2)^*$ - $\alpha g$ -closed set need not be  $(1, 2)^*$ -  $M_{\delta\pi}$  -closed set as shown in the following example.

**Example: 3. 26** Let  $X = \{a, b, c, d\}$ ,  $\tau_1 = \{\Phi, X, \{a\}, \{a, b\}\}$ ,  $\tau_2 = \{\Phi, X, \{b\}\}$ . Then the sets  $\{c\}$ ,  $\{d\}$ ,  $\{a, c\}$ ,  $\{a, d\}$ ,  $\{b, c\}$ ,  $\{b, d\}$ ,  $\{a, b, c\}$ ,  $\{a, b, d\}$  are  $(1, 2)^*$ - $\alpha g$ -closed set, but not  $(1, 2)^*$ -  $M_{\delta\pi}$  -closed set in  $X$ .

**Proposition: 3. 27** Every  $(1, 2)^*$ -  $M_{\delta\pi}$  -closed set is  $(1, 2)^*$ - $g$ -closed set.

**Proof:** The proof is obvious.

**Remark: 3. 28** A  $(1, 2)^*$ -  $g$ -closed set need not be  $(1, 2)^*$ -  $M_{\delta\pi}$  -closed set as shown in the following example.

**Example: 3. 29** Let  $X = \{a, b, c, d\}$ ,  $\tau_1 = \{\Phi, X, \{a\}\}$ ,  $\tau_2 = \{\Phi, X, \{b\}\}$ . Then the sets  $\{c\}$ ,  $\{d\}$ ,  $\{a, c\}$ ,  $\{a, d\}$ ,  $\{b, c\}$ ,  $\{b, d\}$ ,  $\{a, b, c\}$ ,  $\{a, b, d\}$  are  $(1, 2)^*$ -  $g$ -closed set, but not  $(1, 2)^*$ -  $M_{\delta\pi}$  -closed set in  $X$ .

**Definition: 3. 30** A subset  $A$  of a bitopological space  $X$  is called  $(1, 2)^*$ - $\delta g$ - closed if  $(1, 2)^*\text{-}\delta\text{cl}(A) \subseteq A$  whenever  $A \subseteq U$  and  $U$  is  $(1, 2)^*$ -  $\hat{g}$  -open.

**Proposition: 3. 31** Every  $(1, 2)^*$ -  $M_{\delta\pi}$  -closed set is  $(1, 2)^*$ -  $\hat{\delta g}$  -closed set.

**Proof:** The proof is straightforward, since every  $(1, 2)^*$ -  $\hat{g}$  -closed set is  $(1, 2)^*$ - $\pi g$ -closed.

**Remark: 3. 32** A  $(1, 2)^*$ - $\hat{\delta g}$  -closed set need not be  $(1, 2)^*$ -  $M_{\delta\pi}$  -closed set as shown in the following example.

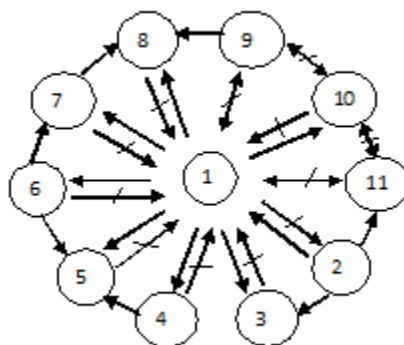

**Example: 3. 33** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\Phi, X, \{a\}, \{a, b\}\}$ ,  $\tau_2 = \{\Phi, X, \{b\}, \{a, c\}\}$ . Then the sets  $\{c\}$ ,  $\{b, c\}$  are  $(1, 2)^*-\delta \hat{g}$ -closed set, but not  $(1, 2)^*-\text{M}_{\delta\pi}$ -closed set in X.

**Remark: 3. 34** The following examples show that  $(1, 2)^*-\text{M}_{\delta\pi}$ -closedness is independent from  $(1, 2)^*-\text{g}\alpha$ -closed set,  $(1, 2)^*-\alpha$ -closed.

**Example: 3. 35** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\Phi, X, \{a\}, \{a, b\}\}$ ,  $\tau_2 = \{\Phi, X, \{b\}, \{a, c\}\}$ . Then the set  $\{b\}$  &  $\{a, c\}$  are  $(1, 2)^*-\text{M}_{\delta\pi}$ -closed set, but neither  $(1, 2)^*-\text{g}\alpha$ -closed nor  $(1, 2)^*-\alpha$ -closed.

**Example: 3. 36** Let  $X = \{a, b, c, d\}$ ,  $\tau_1 = \{\Phi, X, \{a\}\}$ ,  $\tau_2 = \{\Phi, X, \{b\}, \{a, b\}\}$ . Then the sets  $\{c\}$  and  $\{d\}$  are  $(1, 2)^*-\alpha$ -closed set and  $(1, 2)^*-\text{g}\alpha$ -closed, but not  $(1, 2)^*-\text{M}_{\delta\pi}$ -closed set in X.

**Remark: 3. 37** The following diagram shows the relationships of  $(1, 2)^*-\text{M}_{\delta\pi}$ -closed sets with other known existing sets.  $A \longrightarrow B$  represents A implies B, but not conversely.

(1, 2)\*-δg-closed set.

1.  $(1, 2)^*-\text{M}_{\delta\pi}$ -closed set
2.  $(1, 2)^*-\delta$ -closed set
3.  $(1, 2)^*-\delta\text{g}$ -closed set.
4.  $(1, 2)^*-\pi\text{g}$ -closed
5.  $(1, 2)^*-\pi\text{g}\alpha$ -closed set
6.  $(1, 2)^*-\text{strongly-}\pi\text{g}\alpha$ -closed set
7.  $(1, 2)^*-\text{g}$ -closed set
8.  $(1, 2)^*-\alpha\text{g}$ -closed set
9.  $(1, 2)^*-\alpha$ -closed
10.  $(1, 2)^*-\delta \hat{g}$ -closed set
11.  $(1, 2)^*-\text{g}\alpha$ -closed set.

#### 4. CHARACTERISATION

**Theorem: 4. 1** The union of  $(1, 2)^*-\text{M}_{\delta\pi}$ -closed sets is  $(1, 2)^*-\text{M}_{\delta\pi}$ -closed.

**Proof:** Let  $\{A_i / i=1, 2, \dots, n\}$  be a finite class of  $(1, 2)^*-\text{M}_{\delta\pi}$ -closed subsets of a space X. Then for each  $(1, 2)^*-\pi\text{g}$ -open set,  $U_i A_i \subseteq U_i U_i = V$ . Since arbitrary union of  $(1, 2)^*-\pi\text{g}$ -open sets in X is also  $(1, 2)^*-\pi\text{g}$ -open set in X, V is  $(1, 2)^*-\pi\text{g}$ -open set in X. Also  $U_i (1, 2)^*-\delta\text{cl}(A_i) = (1, 2)^*-\delta\text{cl}(U_i A_i) \subseteq V$ . Therefore,  $U_i A_i$  is  $(1, 2)^*-\text{M}_{\delta\pi}$ -closed set in X.

**Remark: 4. 2** Intersection of any  $(1, 2)^*-\text{M}_{\delta\pi}$ -closed sets in X need not be  $(1, 2)^*-\text{M}_{\delta\pi}$ -closed. Let  $X = \{a, b, c, d\}$ ,  $\tau_1 = \{\Phi, X, \{a\}, \{a, b, d\}\}$ ,  $\tau_2 = \{\Phi, X, \{c\}, \{b, c, d\}\}$ . Then the sets  $\{b, d\}$  and  $\{a, b, c\}$  are  $(1, 2)^*-\text{M}_{\delta\pi}$ -closed sets, but the intersection  $\{b\}$  is not  $(1, 2)^*-\text{M}_{\delta\pi}$ -closed.

**Proposition: 4. 3** Let A be a  $(1, 2)^*-\text{M}_{\delta\pi}$ -closed set of X. Then  $(1, 2)^*-\delta\text{cl}(A)-A$  does not contain non-empty  $(1, 2)^*-\pi\text{g}$ -closed set.

**Proof:** Suppose that A is  $(1, 2)^*-\text{M}_{\delta\pi}$ -closed, let F be a  $(1, 2)^*-\pi\text{g}$ -closed set contained in  $(1, 2)^*-\delta\text{cl}(A)-A$ . Now  $F^C$  is  $(1, 2)^*-\pi\text{g}$ -open set of X such that  $A \subseteq F^C$ . Since A is  $(1, 2)^*-\text{M}_{\delta\pi}$ -closed set of X, then  $(1, 2)^*-\delta\text{cl}(A) \subseteq F^C$ .

Thus  $F \subseteq [(1, 2)^*-\delta\text{cl}(A)]^C$ . Also  $F \subseteq (1, 2)^*-\delta\text{cl}(A)-A$ . Therefore,  $F \subseteq [(1, 2)^*-\delta\text{cl}(A)]^C \cap [(1, 2)^*-\delta\text{cl}(A)] = \Phi$ . Hence  $F=\Phi$ .

**Proposition: 4. 4** If A is (1, 2)\*- $\pi g$ -open and (1, 2)\*- $M_{\delta\pi}$ -closed subset of X, then A is an (1, 2)\*- $\delta$ -closed subset of X.

**Proof:** Since A is (1, 2)\*- $\pi g$ -open and (1, 2)\*- $M_{\delta\pi}$ -closed,  $(1, 2)^*\delta cl(A) \subseteq A$ . Hence A is (1, 2)\*- $\delta$ -closed.

**Theorem: 4. 5** The intersection of a (1, 2)\*- $M_{\delta\pi}$ -closed set and (1, 2)\*- $\delta$ -closed set is always (1, 2)\*-  $M_{\delta\pi}$ -closed.

**Proof:** Let A be (1, 2)\*-  $M_{\delta\pi}$ -closed and F be (1, 2)\*- $\delta$ -closed. If U is an (1, 2)\*- $\pi g$ -open set with  $A \cap F \subseteq U$ , then  $A \subseteq U \cup F^c$  and so  $(1, 2)^*\delta cl(A) \subseteq U \cup F^c$ . Now  $(1, 2)^*\delta cl(A \cap F) \subseteq (1, 2)^*\delta cl(A) \cap F \subseteq U$ .

Hence  $A \cap F$  is (1, 2)\*-  $M_{\delta\pi}$ -closed.

**Proposition: 4. 6** If A is a (1, 2)\*- $M_{\delta\pi}$ -closed set in a space X and  $A \subseteq B \subseteq (1, 2)^*\delta cl(A)$ , then B is also (1, 2)\*- $M_{\delta\pi}$ -closed set.

**Proof:** Let U be (1, 2)\*- $\pi g$ -open set of X such that  $B \subseteq U$ . Then  $A \subseteq U$ . Since A is (1, 2)\*- $M_{\delta\pi}$ -closed set,  $(1, 2)^*\delta cl(A) \subseteq U$ . Also, since,  $B \subseteq (1, 2)^*\delta cl(A)$ ,  $(1, 2)^*\delta cl(B) \subseteq (1, 2)^*\delta cl((1, 2)^*\delta cl(A)) = (1, 2)^*\delta cl(A)$ . Hence  $(1, 2)^*\delta cl(B) \subseteq U$ . Therefore, B is also a (1, 2)\*- $M_{\delta\pi}$ -closed set.

**Proposition: 4. 7** Let A be a (1, 2)\*- $M_{\delta\pi}$ -closed set of X. Then A is (1, 2)\*- $\delta$ -closed iff  $(1, 2)^*\delta cl(A) - A$  is (1, 2)\*-  $\pi g$ -closed set.

**Proof: Necessity.** Let A be (1, 2)\*- $\delta$ -closed subset of X. Then,  $(1, 2)^*\delta cl(A) = A$  and so  $(1, 2)^*\delta cl(A) - A = \Phi$ , which is (1, 2)\*- $\pi g$ -closed set.

**Sufficiency.** Since A is (1, 2)\*- $M_{\delta\pi}$ -closed, by proposition 4. 3,  $(1, 2)^*\delta cl(A) - A$  does not contain a non-empty (1, 2)\*-  $\pi g$ -closed set. But  $(1, 2)^*\delta cl(A) - A = \Phi$ . That is,  $(1, 2)^*\delta cl(A) = A$ . Hence A is (1, 2)\*- $\delta$ -closed.

## 5. APPLICATIONS

**Definition: 5. 1** A space X is called (1, 2)\*- $T_{\delta\pi g}$ -space if every (1, 2)\*- $M_{\delta\pi}$ -closed set in it is an (1, 2)\*- $\delta$ -closed.

**Definition: 5. 2** A space X is called a (1, 2)\*- $T_{\delta g}$ -space if every (1, 2)\*- $\delta g$ -closed set in it is (1, 2)\*- $\delta$ -closed.

**Theorem: 5. 3** For a bitopological space X, the following conditions are equivalent.

- (1) X is a (1, 2)\*- $T_{\delta\pi g}$ -space.
- (2) Every singleton  $\{x\}$  is either (1, 2)\*- $\pi g$ -closed or (1, 2)\*- $\delta$ -open.

**Proof:**

(1) => (2): Let  $x \in X$ . Suppose  $\{x\}$  is not a (1, 2)\*- $\pi g$ -closed set of X. Then  $X - \{x\}$  is not a (1, 2)\*- $\pi g$ -open set. Thus  $X - \{x\}$  is an (1, 2)\*- $M_{\delta\pi}$ -closed set of X. Since X is (1, 2)\*- $T_{\delta\pi g}$ -space,  $X - \{x\}$  is an (1, 2)\*- $\delta$ -closed set of X, i. e.,  $\{x\}$  is (1, 2)\*- $\delta$ -open set of X.

(3) => (1): Let A be an (1, 2)\*- $M_{\delta\pi}$ -closed set of X. Let  $x \in (1, 2)^*\delta cl(A)$ . By (2),  $\{x\}$  is either (1, 2)\*- $\pi g$ -closed or (1, 2)\*- $\delta$ -open.

**Case (i):** Let  $\{x\}$  be (1, 2)\*-  $\pi g$ -closed set. If we assume that  $x \notin A$  then we would have  $x \in (1, 2)^*\delta cl(A) - A$ , which cannot happen according to proposition 4. 3. Hence  $x \in A$ .

**Case (ii):** Let  $\{x\}$  be (1, 2)\*- $\delta$ -open set. Since  $x \in (1, 2)^*\delta cl(A)$ , then  $\{x\} \cap A \neq \Phi$ . This shows that  $x \in A$ . So in both cases we have  $(1, 2)^*\delta cl(A) \subseteq A$ . Trivially  $A \subseteq (1, 2)^*\delta cl(A)$ . Therefore,  $A = (1, 2)^*\delta cl(A)$  or equivalently A is (1, 2)\*- $\delta$ -closed. Hence X is a (1, 2)\*- $T_{\delta\pi g}$ -space.

**Theorem: 5. 4** Every (1, 2)\*- $T_{\delta g}$ -space is a (1, 2)\*- $T_{\delta\pi g}$ -space.

**Proof:** The proof is straight forward, since every (1, 2)\*- $M_{\delta\pi}$ -closed set is (1, 2)\*- $\delta g$ -closed set.

**Remark: 5. 5** The converse of the above theorem is not true as it can be seen from the following example.

**Example: 5. 6** Let  $X = \{a, b, c, d\}$ ,  $\tau_1 = \{\Phi, X, \{a\}, \{a, b, d\}\}$ ,  $\tau_2 = \{\Phi, X, \{c\}, \{b, c, d\}\}$ . Then X is a (1, 2)\*- $T_{\delta\pi g}$ -space, but not (1, 2)\*- $T_{\delta g}$ -space.

**Definition: 5. 7** A space X is called a  $(1, 2)^*\text{-}T_{\delta}^{\wedge}g$ -space if every  $(1, 2)^*\text{-}\delta g$ -closed set in it is  $(1, 2)^*\text{-}\delta$ -closed.

**Theorem: 5. 8** Every  $(1, 2)^*\text{-}T_{\delta}^{\wedge}g$ -space is a  $(1, 2)^*\text{-}T_{\delta\pi g}$ -space.

**Proof:** The proof is straight forward, since every  $(1, 2)^*\text{-}M_{\delta\pi}$ -closed set is  $(1, 2)^*\text{-}\delta g$ -closed set.

**Remark: 5. 9** The converse of the above theorem is not true as it can be seen from the example.

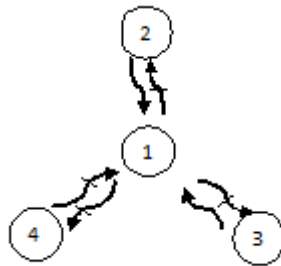

Let  $X = \{a, b, c, d\}$ ,  $\tau_1 = \{\Phi, X, \{a\}\}$ ,  $\tau_2 = \{\Phi, X, \{a, b, d\}\}$ , X is  $(1, 2)^*\text{-}T_{\delta\pi g}$ -space, but not  $(1, 2)^*\text{-}T_{\delta}^{\wedge}g$ -space.

**Remark: 5. 10**  $(1, 2)^*\text{-}T_{\delta\pi g}$ -space and  $(1, 2)^*\text{-}T_{1/2}$ -space are independent of one another as the Following examples show.

**Example: 5. 11** Let  $X = \{a, b, c, d\}$ ,  $\tau_1 = \{\Phi, X, \{a\}\}$ ,  $\tau_2 = \{\Phi, X, \{b\}\}$ , X is  $(1, 2)^*\text{-}T_{\delta\pi g}$ -space, but not  $(1, 2)^*\text{-}T_{1/2}$ -space.

**Example: 5. 12** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\Phi, X, \{a\}\}$ ,  $\tau_2 = \{\Phi, X, \{a, b, d\}\}$ . Then X is a  $(1, 2)^*\text{-}T_{1/2}$ -space, but not  $(1, 2)^*\text{-}T_{\delta\pi g}$ -space.

**Remark: 5. 13** The following diagram shows the relationships  $(1, 2)^*\text{-}T_{\delta\pi g}$ -space with other known existing spaces.  $A \longrightarrow B$  represents A implies B, but not conversely.

1.  $(1, 2)^*\text{-}T_{\delta\pi g}$ -space 2.  $(1, 2)^*\text{-}T_{\delta g}$ -space 3.  $(1, 2)^*\text{-}T_{\delta}^{\wedge}g$ -space 4.  $(1, 2)^*\text{-}T_{1/2}$ -space
