### ABSTRACT

We introduce the concept of  $^*g\alpha$ -closed sets in a topological space and characterize it using its Gao-kernel. Moreover we investigate new separation axioms and new functions in topological spaces. For the digital plane, we have explicit forms of Gao-kernel and  $\alpha$ -kernel of a subset in the plane.

**Key words:**  $^*g\alpha$ -closed sets,  ${}_aT_{1/2}^{**}$  spaces,  $T_c^{**}$  spaces,  ${}_aT_c^{**}$  spaces,  ${}^{**}T_{1/2}$  spaces,  $^*g\alpha$ -continuous,  $^*g\alpha$ -irresolute maps,  $^*g\alpha$ -homeomorphism, Gao-kernel,  $\alpha$ -kernel and digital plane.

**AMS Subject Classification:** 54A05, 54C05, 54C10, 68U05, 68U10.

### 1. INTRODUCTION

Levine [14] and Njastad [19] introduced semi-open sets and  $\alpha$ -sets respectively. The complement of a semi-open (resp.  $\alpha$ -open) set is called a semi-closed [3] (resp.  $\alpha$ -closed [19]) set. Levine [13] introduced  $g$ -closed sets and studied their most fundamental properties. S.P. Arya and T. Nour [1], H. Maki et.al. [16, 17] introduced  $gs$ -closed sets,  $\alpha g$ -closed sets and  $g\alpha$ -closed sets respectively. Dontchev [9] and Gnanambal [10] introduced  $gsp$ -closed sets and  $gpr$ -closed sets respectively.

In this paper, we introduce a new class of sets, namely  $^*g\alpha$ -closed sets by generalizing  $g\alpha$ -open sets. This new class is properly placed between the class of closed sets and the class of  $g$ -closed sets. Applying  $^*g\alpha$ -closed sets, we introduce and study some new spaces, namely  ${}_aT_{1/2}^{**}$  spaces,  $T_c^{**}$  spaces,  ${}_aT_c^{**}$  spaces and  ${}^{**}T_{1/2}$  spaces. In the fifth chapter we introduce and study  $^*g\alpha$ -continuous,  $^*g\alpha$ -irresolute maps and its group structure., In the sixth chapter we investigate  $^*g\alpha$ -homeomorphism and its properties. In the seventh chapter, we investigate the explicit form in the digital plane of Gao-kernel and  $\alpha$ -kernel which are used for characterization of  $^*g\alpha$ -closed sets and  $g\alpha$ -closed sets, respectively. The digital plane is a mathematical model of the computer screen (cf.[5],[11],[12]).

### 2. PRELIMINARIES

Throughout this paper  $(X, \tau)$ ,  $(Y, \sigma)$  and  $(Z, \eta)$  represent topological space on which no separation axioms are assumed unless otherwise mentioned. For a subset  $A$  of a space  $(X, \tau)$ ,  $cl(A)$ ,  $int(A)$  and  $C(A)$  denote the closure of  $A$ , the interior of  $A$  and the complement of  $A$  in  $X$  respectively.

Let us recall the following definitions, which are useful in the sequel.

**Definition 2.1:** A subset  $A$  of a space  $(X, \tau)$  is called

1. a *semi-open* set [14] if  $A \subseteq cl(int(A))$  and a *semi-closed* set if  $int(cl(A)) \subseteq A$ ,
2. an  *$\alpha$ -open* set [19] if  $A \subseteq int(cl(int(A)))$  and an  *$\alpha$ -closed* set if  $cl(int(cl(A))) \subseteq A$  and

**Definition 2.2:** A subset  $A$  of a space  $(X, \tau)$  is called

1. a *generalized closed* (briefly  *$g$ -closed*) set [13] if  $cl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ . The complement of a  $g$ -closed set is called a  $g$ -open set,
2. a *generalized semi-closed* (briefly  *$gs$ -closed*) set [1] if  $scl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ ,
3. an  *$\alpha$ -generalized closed* (briefly  *$\alpha g$ -closed*) set [16] if  $\alpha cl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ . The complement of an  $\alpha g$ -closed set is called an  $\alpha g$ -open set,
4. a *generalized  $\alpha$ -closed* (briefly  *$g\alpha$ -closed*) set [17] if  $\alpha cl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\alpha$ -open in  $(X, \tau)$ ,
5. a *generalized preclosed* (briefly  *$gp$ -closed*) set [18] if  $pcl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ ,
6. a *generalized semi-preclosed* (briefly  *$gsp$ -closed*) set [9] if  $spcl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ ,
7. a *generalized preregular closed* (briefly  *$gpr$ -closed*) set [10] if  $pcl(A) \subseteq U$  whenever  $A \subseteq U$  and is regular open in  $(X, \tau)$ ,

**Definition 2.3:** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called

1. semi-continuous [14] if  $f^{-1}(V)$  is semi-open in  $(X, \tau)$  for every closed set  $V$  of  $(Y, \sigma)$ ,
2.  $\alpha$ -continuous [15] if  $f^{-1}(V)$  is  $\alpha$ -closed in  $(X, \tau)$  for every closed set  $V$  of  $(Y, \sigma)$ ,
3.  $g$ -continuous [2] if  $f^{-1}(V)$  is  $g$ -closed in  $(X, \tau)$  for every closed set  $V$  of  $(Y, \sigma)$ ,
4.  $gs$ -continuous [7] if  $f^{-1}(V)$  is  $gs$ -closed in  $(X, \tau)$  for every closed set  $V$  of  $(Y, \sigma)$ ,
5.  $\alpha g$ -continuous [4] if  $f^{-1}(V)$  is  $\alpha g$ -closed in  $(X, \tau)$  for every closed set  $V$  of  $(Y, \sigma)$ ,
6.  $g\alpha$ -continuous [17] if  $f^{-1}(V)$  is  $g\alpha$ -closed in  $(X, \tau)$  for every closed set  $V$  of  $(Y, \sigma)$ ,
7.  $gsp$ -continuous [9] if  $f^{-1}(V)$  is  $gsp$ -closed in  $(X, \tau)$  for every closed set  $V$  of  $(Y, \sigma)$ ,
8.  $gpr$ -continuous [10] if  $f^{-1}(V)$  is  $gpr$ -closed in  $(X, \tau)$  for every closed set  $V$  of  $(Y, \sigma)$ ,
9.  $gc$ -irresolute [2] if  $f^{-1}(V)$  is  $g$ -closed in  $(X, \tau)$  for every  $g$ -closed set  $V$  of  $(Y, \sigma)$ ,
10.  $gs$ -irresolute [7] if  $f^{-1}(V)$  is  $gs$ -closed in  $(X, \tau)$  for every  $gs$ -closed set  $V$  of  $(Y, \sigma)$ ,
11.  $\alpha g$ -irresolute [4] if  $f^{-1}(V)$  is  $\alpha g$ -closed in  $(X, \tau)$  for every  $\alpha g$ -closed set  $V$  of  $(Y, \sigma)$  and
12.  $g\alpha$ -irresolute [17] if  $f^{-1}(V)$  is  $g\alpha$ -closed in  $(X, \tau)$  for every  $g\alpha$ -closed set  $V$  of  $(Y, \sigma)$ .

**Definition 2.4:** A space  $(X, \tau)$  is called

1. a  $T_{1/2}$  space [13] if every  $g$ -closed set is closed,
2. a  $T_b$  space [6] if every  $gs$ -closed set is closed,
3. a  $T_d$  space [6] if every  $gs$ -closed set is  $g$ -closed,
4. an  ${}_aT_b$  space [4] if every  $\alpha g$ -closed set is closed,
5. an  ${}_aT_d$  space [4] if every  $\alpha g$ -closed set is  $g$ -closed.

**Notation 2.5:** For a space  $(X, \tau)$ ,  $C(X, \tau)$  (resp.  $SC(X, \tau)$ ,  $\alpha C(X, \tau)$ ,  $G\alpha C(X, \tau)$ ,  $GC(X, \tau)$ ,  $GSC(X, \tau)$ ,  $\alpha GC(X, \tau)$ ) denote the class of all closed (resp. semi-closed,  $\alpha$ -closed,  $g\alpha$ -closed,  $g$ -closed,  $gs$ -closed,  $\alpha g$ -closed) subsets of  $(X, \tau)$ .

### 3. BASIC PROPERTIES OF ${}^*g\alpha$ -CLOSED SETS

We introduce the following definition.

**Definition 3.1:** A subset  $A$  of  $(X, \tau)$  is called a  ${}^*g\alpha$ -closed set if  $cl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $g\alpha$ -open in  $(X, \tau)$ .

The class of  ${}^*g\alpha$ -closed subsets of  $(X, \tau)$  is denoted by  ${}^*G\alpha C(X, \tau)$ .

**Theorem 3.2:** Every closed set is a  ${}^*g\alpha$ -closed set.

**Proof:** Let  $A \subseteq U$ , where  $U$  is  $g\alpha$ -open set in  $X$ . Since  $A$  is closed,  $cl(A) = A \subseteq U$ . Therefore  $cl(A) \subseteq U$ .

Hence  $A$  is  ${}^*g\alpha$ -closed.

Following example shows that the above implication is not reversible.

**Example 3.3:** Let  $X = \{a, b, c\}$  and  $\tau = \{X, \phi, \{a, b\}\}$ .  ${}^*G\alpha C(X, \tau) = \{X, \phi, \{c\}, \{b, c\}, \{a, c\}\}$ .

Here  $\{b, c\}$  is a  ${}^*g\alpha$ -closed set of  $(X, \tau)$  but it is not a closed set of  $(X, \tau)$ .

**Theorem 3.4:** Every  ${}^*g\alpha$ -closed set is  $g$ -closed set.

**Proof:** Let  $A \subseteq U$ , where  $U$  is an open set in  $X$ . Since every open set is  $g\alpha$ -open,  $U$  is  $g\alpha$ -open. Since  $A$  is  ${}^*g\alpha$ -closed,  $cl(A) \subseteq U$ . Hence  $A$  is  $g$ -closed.

Following example shows that the above implication is not reversible.

**Example 3.5:** Let  $X = \{a, b, c\}$  and  $\tau = \{X, \phi, \{a\}, \{b, c\}\}$ .  $GC(X, \tau) = \{X, \phi, \{a\}, \{b\}, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}\}$ .  ${}^*G\alpha C(X, \tau) = \{X, \phi, \{a\}, \{b, c\}\}$ .

Here  $\{b\}$  is a  $g$ -closed set of  $(X, \tau)$  it is not a  ${}^*g\alpha$ -closed set of  $(X, \tau)$ .

**Theorem 3.6:** Every  ${}^*g\alpha$ -closed set is  $g\alpha$ -closed set.

**Proof:** Let  $A \subseteq U$ , where  $U$  is an  $\alpha$ -open set in  $X$ . Since every  $\alpha$ -open set is  $g\alpha$ -open,  $U$  is  $g\alpha$ -open. Since  $A$  is  ${}^*g\alpha$ -closed,  $cl(A) \subseteq U$ . But  $\alpha cl(A) \subseteq cl(A) \subseteq U$ . Therefore  $A$  is  $g\alpha$ -closed.

**Corresponding author: M. Vigneshwaran\***

*Department of Mathematics, Kongunadu Arts and Science College (Autonomous), Coimbatore-641 029*

Following example shows that the above implication is not reversible.

**Example 3.7:** Let  $X$  and  $\tau$  be as in the example 3.5. Let  $A = \{a, c\}$ .  $A$  is a  $g\alpha$ -closed set of  $(X, \tau)$ . But  $A$  is not a  $^*g\alpha$ -closed set of  $(X, \tau)$ .

**Theorem 3.8:** Every  $^*g\alpha$ -closed set is  $gp$ -closed set.

**Proof:** Let  $A \subseteq U$ , where  $U$  is an open set in  $X$ . Since every open set is  $g\alpha$ -open,  $U$  is  $g\alpha$ -open. Since  $A$  is  $^*g\alpha$ -closed,  $cl(A) \subseteq U$ . But  $pcl(A) \subseteq cl(A) \subseteq U$ . Therefore  $A$  is  $gp$ -closed set.

Following example shows that the above implication is not reversible.

**Example 3.9:** Let  $X$  and  $\tau$  be as in the example 3.5. Let  $B = \{a, b\}$ .  $B$  is a  $gp$ -closed set of  $(X, \tau)$ . But  $B$  is not a  $^*g\alpha$ -closed set of  $(X, \tau)$ .

Thus the class of  $^*g\alpha$ -closed sets are contained in the class of  $g$ -closed sets,  $g\alpha$ -closed sets,  $\alpha g$ -closed sets,  $gs$ -closed sets,  $gsp$ -closed sets,  $gpr$ -closed sets and  $gp$ -closed sets. The class of  $^*g\alpha$ -closed sets contains the class of closed sets.

**Remark 3.10:**  $^*g\alpha$ -closedness is independent of semi-closedness and  $\alpha$ -closedness.

**Proof:** It can be seen by the following example.

**Example 3.11:** Let  $X = \{a, b, c\}$  and  $\tau = \{X, \phi, \{a\}\}$ .  $SC(X, \tau) = \{X, \phi, \{b\}, \{c\}, \{b, c\}\} = \alpha C(X, \tau)$   
 $^*GaC(X, \tau) = \{X, \phi, \{b, c\}\}$ .

Here  $\{b\}$  is semi-closed set and  $\alpha$ -closed set of  $(X, \tau)$ . But it is not a  $^*g\alpha$ -closed set of  $(X, \tau)$ .

**Example 3.12:** Let  $X$  and  $\tau$  be as in the example 3.3. Here  $\{b, c\}$  is not a semi-closed and  $\alpha$ -closed set of  $(X, \tau)$ . But it is a  $^*g\alpha$ -closed set of  $(X, \tau)$ .

**Theorem 3.13:** The intersection of two  $g\alpha$ -closed sets is again in  $g\alpha$ -closed set.

**Proof:** Let  $A$  and  $B$  are  $g\alpha$ -closed sets. Let  $A \cap B \subseteq U$ ,  $U$  is  $\alpha$ -open. Since  $A$  and  $B$  are  $g\alpha$ -closed sets,  $\alpha cl(A) \subseteq U$  and  $\alpha cl(B) \subseteq U$ . This implies that  $\alpha cl(A \cap B) = \alpha cl(A) \cap \alpha cl(B) \subseteq U \Rightarrow \alpha cl(A \cap B) \subseteq U$ . Therefore  $A \cap B$  is  $g\alpha$ -closed.

**Theorem 3.14:** Let  $A$  be an open set and  $B$  be an  $g\alpha$ -open set, then  $A \cup B$  is  $g\alpha$ -open set.

**Proof:** Suppose that  $A$  is an open set and  $B$  is an  $g\alpha$ -open set. Since every open set is  $g\alpha$ -open set,  $A$  is  $g\alpha$ -open set. Then  $A \cup B$  is  $g\alpha$ -open set, since union of two  $g\alpha$ -open set is again  $g\alpha$ -open set.

**Theorem 3.15:**

1. Let  $A$  be a  $^*g\alpha$ -closed set of  $(X, \tau)$  if and only if  $cl(A) - A$  does not contain any non empty  $g\alpha$ -closed set.
2. If  $A$  is a  $^*g\alpha$ -closed and  $A \subseteq B \subseteq cl(A)$ , then  $B$  is  $^*g\alpha$ -closed.

**Proof:**

**1. Necessity part-** Suppose that  $A$  is  $^*g\alpha$ -closed and let  $F$  be a non empty  $g\alpha$ -closed set with  $F \subseteq cl(A) - A$ . Then  $A \subseteq X - F$  and so  $cl(A) \subseteq X - F$ . Hence  $F \subseteq X - cl(A)$ , a contradiction.

**Sufficient part -** Suppose  $A$  is a subset of  $(X, \tau)$  such that  $cl(A) - A$  does not contain any non-empty  $g\alpha$ -closed set. Let  $U$  be a  $g\alpha$ -open set of  $(X, \tau)$  such that  $A \subseteq U$ . If  $cl(A) \subseteq U$ , then  $cl(A) \cap C(U) = \phi$ . Then  $\phi \neq cl(A) \cap C(U)$  is a  $g\alpha$ -closed set of  $(X, \tau)$ , since the intersection of two  $g\alpha$ -closed sets is again  $g\alpha$ -closed set.

**2.** Let  $U$  be a  $g\alpha$ -open set of  $(X, \tau)$  such that  $B \subseteq U$ . Then  $A \subseteq U$ . Since  $A$  is  $^*g\alpha$ -closed,  $cl(A) \subseteq U$ . Now  $cl(B) \subseteq cl(cl(A)) = cl(A) \subseteq U$ . Therefore  $B$  is also a  $^*g\alpha$ -closed set of  $(X, \tau)$ .

**Theorem 3.16:** Let  $X$  be a topological space. A subset  $A$  of  $(X, \tau)$  is  $^*g\alpha$ -open if and only if  $U \subseteq Int(A)$ , whenever  $U$  is  $g\alpha$ -closed set and  $U \subseteq A$ .

**Proof:** Let  $A$  be a  $^*g\alpha$ -open set and  $U$  is  $g\alpha$ -closed set such that  $U \subseteq A$  implies  $X - U \supseteq X - A$  and  $X - A$  is  $^*g\alpha$ -closed set. So  $cl(X - A) \subseteq X - U$  implies  $(X - cl(X - A)) \supseteq (X - (X - U)) = U$ . But  $(X - cl(X - A)) = Int(A)$ . Thus  $U \subseteq Int(A)$ .

Conversely, suppose A is subset such that  $U \subseteq \text{Int}(A)$ . Whenever U is  $g\alpha$ -closed and  $U \subseteq A$ . We show that X-A is  $^*g\alpha$ -closed set. Let  $X-A \subseteq U$ , where U is  $g\alpha$ -open. Since  $X-A \subseteq U$  implies  $X-U \subseteq A$ . By assumption that we must have  $X-U \subseteq \text{Int}(A)$  or  $X-\text{Int}(A) \subseteq U$ . Now  $X-\text{Int}(A) = \text{cl}(X-A)$  which implies that  $\text{cl}(X-A) \subseteq U$  and X-A is  $^*g\alpha$ -closed set.

**Theorem 3.17:** The union of two  $^*g\alpha$ -closed sets is a  $^*g\alpha$ -closed set.

**Proof:** Let A and B are  $^*g\alpha$ -closed sets. Let  $A \cup B \subseteq U$ , U is  $g\alpha$ -open. Since A and B are  $^*g\alpha$ -closed sets,  $\text{cl}(A) \subseteq U$  and  $\text{cl}(B) \subseteq U$ . This implies that  $\text{cl}(A \cup B) = \text{cl}(A) \cup \text{cl}(B) \subseteq U \Rightarrow \text{cl}(A \cup B) \subseteq U$ . Therefore  $A \cup B$  is  $^*g\alpha$ -closed.

**Remark 3.18:** The intersection of two  $^*g\alpha$ -closed sets is again in  $^*g\alpha$ -closed set.

- (i) The intersection of two  $^*g\alpha$ -closed sets is again in  $^*g\alpha$ -closed set.
- (ii) The intersection of an open and a  $^*g\alpha$ -open sets is a  $^*g\alpha$ -open set.
- (iii) The union of an open and a  $^*g\alpha$ -open sets is a  $^*g\alpha$ -open set.

**We prepare the following notations:**

For a subset A of  $(X, \tau)$ ,  
 $G\alpha O(X, \tau) = \{U/U \text{ is } g\alpha\text{-open in } (X, \tau)\};$   
 $\text{ker}(A) = \cap \{U/U \in \tau \text{ and } A \subseteq U\};$   
 $\alpha\text{-ker}(A) = \cap \{U/U \text{ is } \alpha\text{-open set and } A \subseteq U\};$   
 $G\alpha O\text{-ker}(A) = \cap \{U/U \in G\alpha O(X, \tau) \text{ and } A \subseteq U\}.$   
 $X_{g\alpha c} = \{x \in X / \{x\} \text{ is } g\alpha\text{-closed in } (X, \tau)\} \text{ and}$   
 $X_{^*g\alpha o} = \{x \in X / \{x\} \text{ is } ^*g\alpha\text{-open in } (X, \tau)\}.$

**Theorem 3.19:** Any subset A is  $g\alpha$ -closed set if and only if  $\alpha\text{cl}(A) \subseteq \alpha\text{-ker}(A)$  holds.

**Proof: Necessary:** We know that  $A \subseteq \alpha\text{-ker}(A)$ . Since A is  $g\alpha$ -closed, then  $\alpha\text{cl}(A) \subseteq \alpha\text{-ker}(A)$ .

**Sufficiency:** Let  $A \subseteq U$  and U is  $\alpha$ -open. Given that  $\alpha\text{cl}(A) \subseteq \alpha\text{-ker}(A)$ . If  $U \subseteq \alpha\text{cl}(A)$ , then  $\alpha\text{-ker}(A) \subseteq U \subseteq \alpha\text{cl}(A)$ , which is a contradiction to the hypothesis. Therefore  $\alpha\text{cl}(A) \subseteq U$ . Hence A is  $g\alpha$ -closed.

**Lemma 3.20:** For any space  $(X, \tau)$ ,  $X = X_{g\alpha c} \cup X_{^*g\alpha o}$  holds.

**Proof:** Let  $x \in X$ . Suppose that  $\{x\}$  is not  $^*g\alpha$ -closed set in  $(X, \tau)$ . Then X is a unique  $g\alpha$ -open set containing  $X/\{x\}$ . Thus  $X/\{x\}$  is  $^*g\alpha$ -closed in  $(X, \tau)$  and so  $\{x\}$  is  $^*g\alpha$ -open. Therefore  $x \in X_{g\alpha c} \cup X_{^*g\alpha o}$ .

**Theorem 3.21:** For a subset A of  $(X, \tau)$ , the following conditions are equivalent:

1. A is  $^*g\alpha$ -closed in  $(X, \tau)$ .
2.  $\text{cl}(A) \subseteq G\alpha O\text{-ker}(A)$  holds.
3. (i)  $\text{cl}(A) \cap X_{g\alpha c} \subseteq A$  and (ii)  $\text{cl}(A) \cap X_{^*g\alpha o} \subseteq G\alpha O\text{-ker}(A)$  holds.

**Proof:**

**(1)  $\Rightarrow$  (2):** Let  $x \notin G\alpha O\text{-ker}(A)$ . Then there exists a set  $U \in G\alpha O(X, \tau)$  such that  $x \notin U$  and  $A \subseteq U$ .

Since A is  $^*g\alpha$ -closed,  $\text{cl}(A) \subseteq U$  and  $x \notin \text{cl}(A)$ . This is a contradiction.

**(2)  $\Rightarrow$  (3):**

**(i):** It follows from (2) that  $\text{cl}(A) \cap X_{g\alpha c} \subseteq G\alpha O\text{-ker}(A) \cap X_{g\alpha c}$ . We claim that  $G\alpha O\text{-ker}(A) \cap X_{g\alpha c} \subseteq A$ . Suppose  $x \in G\alpha O\text{-ker}(A) \cap X_{g\alpha c}$  and assume that  $x \notin A$ . Since the set  $X/\{x\} \in G\alpha O(X, \tau)$  and  $A \subseteq X/\{x\}$ . Then we have that  $x \in X/\{x\}$  and so this is a contradiction. Thus we show that  $\text{cl}(A) \cap X_{g\alpha c} \subseteq A$ . by using (2)  $\text{cl}(A) \cap X_{g\alpha c} \subseteq G\alpha O\text{-ker}(A) \cap X_{g\alpha c} \subseteq A$ .

**(ii):** It is obtained by (2).

**(3)  $\Rightarrow$  (2):** By Remark 3.8 and (3),

$$\begin{aligned} \text{cl}(A) &= \text{cl}(A) \cap X = \text{cl}(A) \cap (X_{g\alpha c} \cup X_{^*g\alpha o}) \\ &= (\text{cl}(A) \cap X_{g\alpha c}) \cup (\text{cl}(A) \cap X_{^*g\alpha o}) \\ &\subseteq A \cup G\alpha O\text{-ker}(A) \\ &= G\alpha O\text{-ker}(A). \end{aligned}$$

That is  $cl(A) \subseteq G\alpha O\text{-ker}(A)$  holds.

(2)  $\Rightarrow$  (1): Let  $U \in G\alpha O(X, \tau)$  such that  $A \subseteq U$ . Then we have that  $G\alpha O\text{-ker}(A) \subseteq U$  and so by (2)  $cl(A) \subseteq U$ . Therefore  $A$  is  ${}^*g\alpha$ -closed.

**Remark 3.22:** The following diagram shows the relationships established between  ${}^*g\alpha$ -closed sets and some other sets in theorem 3.2, 3.4, 3.6, 3.8, remark3.10 and reference [22], [21].  $A \rightarrow B$  ( $A \not\leftarrow B$ ) represents  $A$  implies  $B$  but not conversely ( $A$  and  $B$  are independent each other).

#### 4. APPLICATIONS OF ${}^*g\alpha$ -CLOSED SETS

We introduce the following definition.

**Definition 4.1:** A space  $(X, \tau)$  is called an  ${}_aT_{1/2}^{**}$  space if every  ${}^*g\alpha$ -closed set is closed.

The following theorem gives a characterization of  ${}_aT_{1/2}^{**}$  spaces.

**Theorem 4.2:** If  $(X, \tau)$  is an  ${}_aT_{1/2}^{**}$  space, then every singleton of  $X$  is either  $g\alpha$ -closed or open.

**Proof:** Let  $x \in X$  and suppose that  $\{x\}$  is not a  $g\alpha$ -closed set of  $(X, \tau)$ . Then  $X/\{x\}$  is not  $g\alpha$ -open. This implies that  $X$  is the only  $g\alpha$ -open set containing  $X/\{x\}$ , so  $X/\{x\}$  is a  ${}^*g\alpha$ -closed set of  $(X, \tau)$ . Since  $(X, \tau)$  is an  ${}_aT_{1/2}^{**}$  space,  $X/\{x\}$  is closed or equivalently  $\{x\}$  is open in  $(X, \tau)$ .

**Theorem 4.3:** Every  $T_{1/2}$  space is an  ${}_aT_{1/2}^{**}$  space.

**Proof:** Let  $A$  be a  ${}^*g\alpha$ -closed set of  $(X, \tau)$ . Since every  ${}^*g\alpha$ -closed set is  $g$ -closed,  $A$  is  $g$ -closed. Since  $(X, \tau)$  is a  $T_{1/2}$  space,  $A$  is closed. Therefore  $(X, \tau)$  is an  ${}_aT_{1/2}^{**}$  space.

The space in the following example is an  ${}_aT_{1/2}^{**}$  space but not a  $T_{1/2}$  space.

**Example 4.4:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{a\}, \{a, b\}\}$ .

${}^*G\alpha C(X, \tau) = \{X, \phi, \{c\}, \{b, c\}\}$

$GC(X, \tau) = \{X, \phi, \{c\}, \{b, c\}, \{a, c\}\}$ .

Here  $(X, \tau)$  is an  ${}_aT_{1/2}^{**}$  space but not a  $T_{1/2}$  space. Since  $\{a, c\}$  is a  $g$ -closed set but not a closed set.

**Theorem 4.5:** Every  $T_b$  space is an  ${}_aT_{1/2}^{**}$  space.

**Proof:** Let A be a  ${}^*g\alpha$ -closed set of  $(X, \tau)$ . Since every  ${}^*g\alpha$ -closed set is gs-closed, A is gs-closed. Since  $(X, \tau)$  is a  $T_b$  space, A is closed. Therefore  $(X, \tau)$  is an  ${}_aT_{1/2}^{**}$  space.

The space in the following example is an  ${}_aT_{1/2}^{**}$  space but not a  $T_b$  space.

**Example 4.6:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{b\}, \{b, c\}\}$ .  ${}^*GaC(X, \tau) = \{X, \phi, \{a\}, \{a, c\}\}$   
 $GSC(X, \tau) = \{X, \phi, \{a\}, \{c\}, \{a, b\}, \{a, c\}\}$ .

Here  $(X, \tau)$  is an  ${}_aT_{1/2}^{**}$  space but not a  $T_b$  space. Since  $\{a, b\}$  is a gs-closed set but not a closed set.

**Theorem 4.7:** Every  ${}_aT_b$  space is an  ${}_aT_{1/2}^{**}$  space.

**Proof:** Let A be a  ${}^*g\alpha$ -closed set of  $(X, \tau)$ . Since every  ${}^*g\alpha$ -closed set is  $\alpha g$ -closed, A is  $\alpha g$ -closed. Since  $(X, \tau)$  is an  ${}_aT_b$  space, A is closed. Therefore  $(X, \tau)$  is an  ${}_aT_{1/2}^{**}$  space.

The space in the following example is an  ${}_aT_{1/2}^{**}$  space but not an  ${}_aT_b$  space.

**Example 4.8:** Let X and  $\tau$  be as in example 4.6. Here  $(X, \tau)$  is an  ${}_aT_{1/2}^{**}$  space but not an  ${}_aT_b$  space. Since  $\{c\}$  is an  $\alpha g$ -closed set but not a closed set.

**Definition 4.9:** A space  $(X, \tau)$  is called a  $T_c^{**}$  if every gs-closed set is  ${}^*g\alpha$ -closed.

The following theorem gives a characterization of  $T_c^{**}$  spaces.

**Theorem 4.10:** If  $(X, \tau)$  is a  $T_c^{**}$  space, then every singleton of X is either closed or  ${}^*g\alpha$ -open.

**Proof:** Let  $x \in X$  and suppose that  $\{x\}$  is not a closed set of  $(X, \tau)$ . Then  $X/\{x\}$  is not open. This implies X is the only open set containing  $X/\{x\}$ . So  $X/\{x\}$  is a gs-closed set of  $(X, \tau)$ . Since  $(X, \tau)$  is a  $T_c^{**}$  space,  $X/\{x\}$  is a  ${}^*g\alpha$ -closed set or equivalently  $\{x\}$  is  ${}^*g\alpha$ -open in  $(X, \tau)$ .

The converse of the above theorem is not true as can be seen by the following example.

**Example 4.11:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{a\}, \{b\}, \{a, b\}\}$ .  
 ${}^*g\alpha$ -open sets of  $(X, \tau)$  are  $X, \phi, \{a\}, \{b\}, \{a, b\}$ .  
 $GSC(X, \tau) = \{X, \phi, \{a\}, \{b\}, \{c\}, \{b, c\}, \{a, c\}\}$ .  
 ${}^*GaC(X, \tau) = \{X, \phi, \{c\}, \{b, c\}, \{a, c\}\}$ .

Here  $\{a\}$  and  $\{b\}$  are  ${}^*g\alpha$ -open sets and  $\{c\}$  is a closed set but  $(X, \tau)$  is not a  $T_c^{**}$  space. Since  $\{b\}$  is a gs-closed set but not a  ${}^*g\alpha$ -closed set of  $(X, \tau)$ .

**Theorem 4.12:** Every  $T_b$  space is a  $T_c^{**}$  space.

**Proof:** Let A be a gs-closed set of  $(X, \tau)$ . Since  $(X, \tau)$  is a  $T_b$  space, A is closed. Since every closed set is  ${}^*g\alpha$ -closed, A is  ${}^*g\alpha$ -closed set. Therefore  $(X, \tau)$  is a  $T_c^{**}$  space.

The space in the following example is a  $T_c^{**}$  space but not a  $T_b$  space.

**Example 4.13:** Let X and  $\tau$  be as in example 3.3. Here  $(X, \tau)$  is a  $T_c^{**}$  space but not a  $T_b$  space. Since  $\{a, c\}$  is a gs-closed set but not a closed set.

**Theorem 4.14:** Every  $T_c^{**}$  space is a  $T_d$  space.

**Proof:** Let A be a gs-closed set of  $(X, \tau)$ . Since  $(X, \tau)$  is a  $T_c^{**}$  space, A is  ${}^*g\alpha$ -closed. Since every  ${}^*g\alpha$ -closed set is g-closed, A is g-closed set. Therefore  $(X, \tau)$  is a  $T_d$  space.

The space in the following example is a  $T_d$  space but not a  $T_c^{**}$  space.

**Example 4.15:** Let X and  $\tau$  be as in example 3.5. Here  $(X, \tau)$  is a  $T_d$  space but not a  $T_c^{**}$  space. Since  $\{b\}$  is a gs-closed set but not  ${}^*g\alpha$ -closed set.

**Theorem 4.16:** Every  $T_c^{**}$  space is an  ${}_aT_d$  space.

**Proof:** Let A be a  $\alpha g$ -closed set of  $(X, \tau)$ . Since every  $\alpha g$ -closed set is  $gs$ -closed, A is  $gs$ -closed. Since  $(X, \tau)$  is a  $T_c^{**}$  space, A is  $^*g\alpha$ -closed. Since every  $^*g\alpha$ -closed set is  $g$ -closed, A is  $g$ -closed set. Therefore  $(X, \tau)$  is an  ${}_aT_d$  space.

The space in the following example is an  ${}_aT_d$  space but not a  $T_c^{**}$  space.

**Example 4.17:** Let X and  $\tau$  be as in example 3.5. Here  $(X, \tau)$  is an  ${}_aT_d$  space but not a  $T_c^{**}$  space. Since  $\{a, c\}$  is a  $gs$ -closed set but not  $^*g\alpha$ -closed set.

**Theorem 4.18:** The space  $(X, \tau)$  is a  $T_b$  space if and only if it is a  $T_c^{**}$  space and an  ${}_aT_{1/2}^{**}$  space.

**Proof: Necessity part:** By theorem 4.12 and 4.5.

**Sufficient part:** Let A be a  $gs$ -closed sets of  $(X, \tau)$ . Since  $(X, \tau)$  is a  $T_c^{**}$  space, A is  $^*g\alpha$ -closed set. Since  $(X, \tau)$  is an  ${}_aT_{1/2}^{**}$  space, A is closed. Therefore  $(X, \tau)$  is an  $T_b$  space.

**Remark 4.19:**  $T_c^{**}$  space and  ${}_aT_{1/2}^{**}$  space are independent of each other.

It can be seen by the following examples.

**Example 4.20:** Let X and  $\tau$  be as in example 3.5. Here  $(X, \tau)$  is an  ${}_aT_{1/2}^{**}$  space but not a  $T_c^{**}$  space. Since  $\{b\}$  is  $gs$ -closed set but not  $^*g\alpha$ -closed set.

**Example 4.21:** Let X and  $\tau$  be as in example 3.3. Here  $(X, \tau)$  is a  $T_c^{**}$  space but not an  ${}_aT_{1/2}^{**}$  space. Since  $\{b, c\}$  is  $^*g\alpha$ -closed set but not closed set.

**Definition 4.22:** A space  $(X, \tau)$  is called an  ${}_aT_c^{**}$  space if every  $\alpha g$ -closed set is  $^*g\alpha$ -closed.

**Theorem 4.23:** Every  $T_b$  space is an  ${}_aT_c^{**}$  space.

**Proof:** Let A be a  $\alpha g$ -closed set of  $(X, \tau)$ . Since every  $\alpha g$ -closed set is  $gs$ -closed, A is  $gs$ -closed. Since  $(X, \tau)$  is a  $T_b$  space, A is closed. Since every closed set is  $^*g\alpha$ -closed, A is  $^*g\alpha$ -closed set. Therefore  $(X, \tau)$  is a  ${}_aT_c^{**}$  space.

The space in the following example is an  ${}_aT_c^{**}$  space but not a  $T_b$  space.

**Example 4.24:** Let X and  $\tau$  be as in example 3.3. Here  $(X, \tau)$  is an  ${}_aT_c^{**}$  space but not a  $T_b$  space. Since  $\{b, c\}$  is a  $gs$ -closed set but not closed set.

**Theorem 4.25:** Every  ${}_aT_b$  space is an  ${}_aT_c^{**}$  space.

**Proof:** Let A be a  $\alpha g$ -closed set of  $(X, \tau)$ . Since  $(X, \tau)$  is a  ${}_aT_b$  space, A is closed. Since every closed set is  $^*g\alpha$ -closed, A is  $^*g\alpha$ -closed set. Therefore  $(X, \tau)$  is an  ${}_aT_c^{**}$  space.

The space in the following example is an  ${}_aT_c^{**}$  space but not an  ${}_aT_b$  space.

**Example 4.26:** Let X and  $\tau$  be as in example 3.3. Here  $(X, \tau)$  is an  ${}_aT_c^{**}$  space but not an  ${}_aT_b$  space. Since  $\{a, c\}$  is a  $\alpha g$ -closed set but not closed set.

**Theorem 4.27:** Every  ${}_aT_c^{**}$  space is an  ${}_aT_d$  space.

**Proof:** Let A be a  $\alpha g$ -closed set of  $(X, \tau)$ . Since  $(X, \tau)$  is a  ${}_aT_c^{**}$  space, A is  $^*g\alpha$ -closed. Since every  $^*g\alpha$ -closed set is  $g$ -closed, A is  $g$ -closed set. Therefore  $(X, \tau)$  is an  ${}_aT_d$  space.

The space in the following example is an  ${}_aT_d$  space but not an  ${}_aT_c^{**}$  space.

**Example 4.28:** Let X and  $\tau$  be as in example 3.5. Here  $(X, \tau)$  is an  ${}_aT_d$  space but not an  ${}_aT_c^{**}$  space. Since  $\{c\}$  is a  $\alpha g$ -closed set but not  $^*g\alpha$ -closed set.

**Theorem 4.29:** Every  $T_c^{**}$  space is an  ${}_aT_c^{**}$  space.

**Proof:** Let A be a  $\alpha g$ -closed set of  $(X, \tau)$ . Since every  $\alpha g$ -closed set is  $gs$ -closed, A is  $gs$ -closed. Since  $(X, \tau)$  is a  $T_c^{**}$  space, A is  $^*g\alpha$ -closed. Therefore  $(X, \tau)$  is an  ${}_aT_c^{**}$  space.

The space in the following example is an  ${}_aT_c^{**}$  space but not a  $T_c^{**}$  space.

**Example 4.30:** Let  $X$  and  $\tau$  be as in example 4.11. Here  $(X, \tau)$  is an  ${}_aT_c^{**}$  space but not a  $T_c^{**}$  space. Since  $\{a\}$  is a  $g$ -closed set but not  ${}^*g\alpha$ -closed set.

**Theorem 4.31:** The space  $(X, \tau)$  is an  ${}_aT_b$  space if and only if it is a  ${}_aT_c^{**}$  space and an  ${}_aT_{1/2}^{**}$  space.

**Proof: Necessity part:** By theorem 4.25 and 4.7.

**Sufficient part:** Let  $A$  be a  $g$ -closed set of  $(X, \tau)$ . Since  $(X, \tau)$  is an  ${}_aT_c^{**}$  space,  $A$  is  ${}^*g\alpha$ -closed. Since  $(X, \tau)$  is an  ${}_aT_{1/2}^{**}$ ,  $A$  is closed set. Therefore  $(X, \tau)$  is an  ${}_aT_b$  space.

**Remark 4.32:**  ${}_aT_c^{**}$  space and  ${}_aT_{1/2}^{**}$  space are independent of each other.

It can be seen by the following examples.

**Example 4.33:** Let  $X$  and  $\tau$  be as in example 3.5. Here  $(X, \tau)$  is an  ${}_aT_{1/2}^{**}$  space but not an  ${}_aT_c^{**}$  space. Since  $\{b\}$  is  $g$ -closed set but not  ${}^*g\alpha$ -closed set.

**Example 4.34:** Let  $X$  and  $\tau$  be as in example 3.3. Here  $(X, \tau)$  is an  ${}_aT_c^{**}$  space. But not an  ${}_aT_{1/2}^{**}$  space. Since  $\{b, c\}$  is  ${}^*g\alpha$ -closed set but not closed set.

**Definition 4.35:** A space  $(X, \tau)$  is called a  ${}^{**}{}_aT_{1/2}$  space if every  $g$ -closed set is  ${}^*g\alpha$ -closed set.

**Theorem 4.36:** Every  $T_{1/2}$  space is a  ${}^{**}{}_aT_{1/2}$  space.

**Proof:** Let  $A$  be a  $g$ -closed set of  $(X, \tau)$ . Since  $(X, \tau)$  is a  $T_{1/2}$  space,  $A$  is closed. Since every closed set is  ${}^*g\alpha$ -closed,  $A$  is  ${}^*g\alpha$ -closed. Therefore  $(X, \tau)$  is an  ${}^{**}{}_aT_{1/2}$  space.

The space in the following example is a  ${}^{**}{}_aT_{1/2}$  space but not a  $T_{1/2}$  space.

**Example 4.37:** Let  $X$  and  $\tau$  be as in example 3.3. Here  $(X, \tau)$  is a  ${}^{**}{}_aT_{1/2}$  space but not a  $T_{1/2}$  space. Since  $\{b, c\}$  is a  $g$ -closed set but not closed set.

**Theorem 4.38:** Every  $T_b$  space is a  ${}^{**}{}_aT_{1/2}$  space.

**Proof:** Let  $A$  be a  $g$ -closed set of  $(X, \tau)$ . Since every  $g$ -closed set is  $g$ s-closed,  $A$  is  $g$ s-closed set. Since  $(X, \tau)$  is an  $T_b$  space,  $A$  is closed. Since every closed set is  ${}^*g\alpha$ -closed,  $A$  is  ${}^*g\alpha$ -closed. Therefore  $(X, \tau)$  is an  ${}^{**}{}_aT_{1/2}$  space.

The space in the following example is a  ${}^{**}{}_aT_{1/2}$  space but not a  $T_b$  space.

**Example 4.39:** Let  $X$  and  $\tau$  be as in example 3.3. Here  $(X, \tau)$  is a  ${}^{**}{}_aT_{1/2}$  space but not a  $T_b$  space. Since  $\{a, c\}$  is a  $g$ s-closed set but not closed set.

**Theorem 4.40:** Every  ${}_aT_b$  space is a  ${}^{**}{}_aT_{1/2}$  space.

**Proof:** Let  $A$  be a  $g$ -closed set of  $(X, \tau)$ . Since every  $g$ -closed set is  $g$ s-closed,  $A$  is  $g$ s-closed set. Since  $(X, \tau)$  is an  ${}_aT_b$  space,  $A$  is closed. Since every closed set is  ${}^*g\alpha$ -closed,  $A$  is  ${}^*g\alpha$ -closed. Therefore  $(X, \tau)$  is an  ${}^{**}{}_aT_{1/2}$  space.

The space in the following example is a  ${}^{**}{}_aT_{1/2}$  space but not an  ${}_aT_b$  space.

**Example 4.41:** Let  $X$  and  $\tau$  be as in example 3.3. Here  $(X, \tau)$  is a  ${}^{**}{}_aT_{1/2}$  space but not an  ${}_aT_b$  space. Since  $\{a, c\}$  is a  $g$ -closed set but not closed set.

**Theorem 4.42:** Every  $T_c^{**}$  space is a  ${}^{**}{}_aT_{1/2}$  space.

**Proof:** Let  $A$  be a  $g$ -closed set of  $(X, \tau)$ . Since every  $g$ -closed set is  $g$ s-closed,  $A$  is  $g$ s-closed set. Since  $(X, \tau)$  is a  $T_c^{**}$  space,  $A$  is  ${}^*g\alpha$ -closed. Therefore  $(X, \tau)$  is an  ${}^{**}{}_aT_{1/2}$  space.

The space in the following example is a  ${}^{**}{}_aT_{1/2}$  space but not a  $T_c^{**}$  space.

**Example 4.43:** Let  $X$  and  $\tau$  be as in example 4.11. Here  $(X, \tau)$  is an  ${}^{**}{}_aT_{1/2}$  space but not a  $T_c^{**}$  space. Since  $\{a\}$  is a  $g$ s-closed set but not a  ${}^*g\alpha$ -closed set.

**Theorem 4.44:** The space  $(X, \tau)$  is a  $T_{1/2}$  space if and only if it is a  ${}^{**}T_{1/2}$  space and an  ${}_{\alpha}T_{1/2}^{**}$  space.

**Proof: Necessity part:** By theorem 4.36 and 4.3.

**Sufficient part:** Let  $A$  be a  $g$ -closed set of  $(X, \tau)$ . Since  $(X, \tau)$  is a  ${}^{**}T_{1/2}$  space,  $A$  is  ${}^*g\alpha$ -closed. Since  $(X, \tau)$  is an  ${}_{\alpha}T_{1/2}^{**}$  space,  $A$  is closed. Therefore  $(X, \tau)$  is an  $T_{1/2}$  space.

**Remark 4.45:**  ${}^{**}T_{1/2}$  space and  ${}_{\alpha}T_{1/2}^{**}$  space are independent of each other.

It can be seen by the following examples.

**Example 4.46:** Let  $X$  and  $\tau$  be as in example 3.5. Here  $(X, \tau)$  is an  ${}_{\alpha}T_{1/2}^{**}$  space but not an  ${}^{**}T_{1/2}$  space. Since  $\{b\}$  is  $g$ -closed set but not  ${}^*g\alpha$ -closed set.

**Example 4.47:** Let  $X$  and  $\tau$  be as in example 3.3. Here  $(X, \tau)$  is an  ${}^{**}T_{1/2}$  space but not an  ${}_{\alpha}T_{1/2}^{**}$  space. Since  $\{b, c\}$  is  ${}^*g\alpha$ -closed set but not closed set.

**Remark 4.48:** The following diagram shows them relationship among the separation axioms considered in this paper and reference [18], [19].  $A \rightarrow B$  ( $A \leftrightarrow B$ ) represents  $A$  implies  $B$  but  $B$  need not imply  $A$  always ( $A$  and  $B$  are independent of each other).

**5.  ${}^*g\alpha$  – CONTINUITY AND  ${}^*g\alpha$  – IRRESOLUTNESS:**

We introduce the following definition

**Definition 5.1:** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called  ${}^*g\alpha$  – continuous if  $f^{-1}(V)$  is a  ${}^*g\alpha$  – closed set of  $(X, \tau)$  for every closed set  $V$  of  $(Y, \sigma)$ .

**Theorem 5.2:** Every continuous map is  ${}^*g\alpha$  – continuous.

**Proof:** Let  $V$  be a closed set of  $(Y, \sigma)$ . Since  $f$  is continuous  $f^{-1}(V)$  is closed in  $(X, \tau)$ . But every closed set is  ${}^*g\alpha$ -closed set. Hence  $f^{-1}(V)$  is  ${}^*g\alpha$ -closed set in  $(X, \tau)$ . Thus  $f$  is  ${}^*g\alpha$  – continuous.

The converse of the above theorem need not be true by the following example.

**Example 5.3:** Let  $X = \{a, b, c\} = Y$  with  $\tau = \{X, \phi, \{a, b\}\}$  and  $\sigma = \{Y, \phi, \{a\}\}$ .

Define  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a)=b, f(b)=a, f(c)=c$ .

${}^*G\alpha C(X, \tau) = \{X, \phi, \{c\}, \{b, c\}, \{a, c\}\}$ .

Here  $f^{-1}(\{b, c\}) = \{a, c\}$  is not a closed set in  $(X, \tau)$ . Therefore  $f$  is not continuous. However  $f$  is  ${}^*ga$ -continuous.

**Theorem 5.4:** Every  ${}^*ga$ -continuous map is  $g$ -continuous.

**Proof:** Let  $V$  be a closed set of  $(Y, \sigma)$ . Since  $f$  is  ${}^*ga$ -continuous,  $f^{-1}(V)$  is  ${}^*ga$ -closed in  $(X, \tau)$ . But every  ${}^*ga$ -closed set is  $g$ -closed set. Hence  $f^{-1}(V)$  is  $g$ -closed set in  $(X, \tau)$ . Thus  $f$  is  $g$ -continuous.

The converse of the above theorem need not be true by the following example.

**Example 5.5:** Let  $X = \{a, b, c\} = Y$  with  $\tau = \{X, \phi, \{a\}, \{a, c\}\}$  and  $\sigma = \{Y, \phi, \{a\}, \{a, b\}\}$ .

Define  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = b, f(b) = c, f(c) = a$ .

${}^*GaC(X, \tau) = \{X, \phi, \{b\}, \{b, c\}\}$ .

$GaC(X, \tau) = \{X, \phi, \{b\}, \{a, b\}, \{b, c\}\}$ .

Here  $f^{-1}(\{b, c\}) = \{a, b\}$  is not a  ${}^*ga$ -closed set in  $(X, \tau)$ . Therefore  $f$  is not  ${}^*ga$ -continuous. However  $f$  is  $g$ -continuous.

**Theorem 5.6:** Every  ${}^*ga$ -continuous map is  $ga$ -continuous.

**Proof:** Let  $V$  be a closed set of  $(Y, \sigma)$ . Since  $f$  is  ${}^*ga$ -continuous  $f^{-1}(V)$  is  ${}^*ga$ -closed in  $(X, \tau)$ . But every  ${}^*ga$ -closed set is  $ga$ -closed set in  $(X, \tau)$ . Hence  $f^{-1}(V)$  is  $ga$ -closed set in  $(X, \tau)$ . Thus  $f$  is  $ga$ -continuous.

The converse of the above theorem need not be true by the following example.

**Example 5.7:** Let  $X = \{a, b, c\} = Y$  with  $\tau = \{X, \phi, \{a\}, \{b, c\}\}$  and  $\sigma = \{Y, \phi, \{a\}, \{a, c\}\}$ .

Define  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = b, f(b) = c, f(c) = a$ .

${}^*GaC(X, \tau) = \{X, \phi, \{a\}, \{b, c\}\}$ .

$GaC(X, \tau) = \{X, \phi, \{a\}, \{b\}, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}\}$ .

Here  $f^{-1}(\{b, c\}) = \{a, b\}$  is not a  ${}^*ga$ -closed set in  $(X, \tau)$ . Therefore  $f$  is not  ${}^*ga$ -continuous. However  $f$  is  $ga$ -continuous.

**Remark 5.8:** Every  ${}^*ga$ -continuous map is  $ag$ -continuous,  $gs$ -continuous,  $gsp$ -continuous and  $gpr$ -continuous.

**Theorem 5.9:** Every  ${}^*ga$ -continuous map is  $gp$ -continuous.

**Proof:** Let  $V$  be a closed set of  $(Y, \sigma)$ . Since  $f$  is  ${}^*ga$ -continuous  $f^{-1}(V)$  is  ${}^*ga$ -closed in  $(X, \tau)$ . But every  ${}^*ga$ -closed set is  $gp$ -closed set in  $(X, \tau)$ . Hence  $f^{-1}(V)$  is  $gp$ -closed set in  $(X, \tau)$ . Thus  $f$  is  $gp$ -continuous.

The converse of the above theorem need not be true by the following example.

**Example 5.10:** Let  $(X, \tau)$  and  $(Y, \sigma)$  be as in example 5.7. Here  $f^{-1}(\{b, c\}) = \{a, b\}$  is not a  ${}^*ga$ -closed set in  $(X, \tau)$ . Therefore  $f$  is not  ${}^*ga$ -continuous. However  $f$  is  $gp$ -continuous.

**Remark 5.11:**  ${}^*ga$ -continuity is independent of semi-continuity and  $\alpha$ -continuity.

The proof follows from the following example.

**Example 5.12:** Let  $X = \{a, b, c\} = Y$  with  $\tau = \{X, \phi, \{a\}\}$  and  $\sigma = \{Y, \phi, \{a\}, \{a, b\}\}$ .

Define  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = a, f(b) = b, f(c) = c$ .

${}^*GaC(X, \tau) = \{X, \phi, \{b, c\}\}$ .

$SC(X, \tau) = \{X, \phi, \{b\}, \{c\}, \{b, c\}\} = \alpha C(X, \tau)$

Here  $f^{-1}(\{b\}) = \{b\}$  is not a  ${}^*ga$ -closed set in  $(X, \tau)$ . Therefore  $f$  is not  ${}^*ga$ -continuous. However  $f$  is semi-continuous and  $\alpha$ -continuous.

**Example 5.13:** Let  $X = \{a, b, c\} = Y$  with  $\tau = \{X, \phi, \{a, b\}\}$  and  $\sigma = \{Y, \phi, \{b\}, \{b, c\}\}$ .

Define  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = c, f(b) = b, f(c) = a$ .

${}^*GaC(X, \tau) = \{X, \phi, \{c\}, \{b, c\}, \{a, c\}\}$ .  $SC(X, \tau) = \{X, \phi, \{c\}\} = \alpha C(X, \tau)$

Here  $f^{-1}(\{a, c\}) = \{a, c\}$  is not a semi-closed set and  $\alpha$ -closed set in  $(X, \tau)$ . Therefore  $f$  is not semi-continuous and  $\alpha$ -continuous. However  $f$  is  ${}^*ga$ -continuous.

**Remark 5.14:** The composition of two  ${}^*g\alpha$ -continuous map need not be a  ${}^*g\alpha$ -continuous.

The proof follows from the example.

**Example 5.15:** Let  $X=\{a, b, c\}=Y=Z$  with  $\tau=\{ X, \phi, \{a\},\{a, b\} \}$ ,  $\sigma=\{Y, \phi, \{a, b\}\}$  and  $\eta=\{ Z, \phi, \{b\},\{b, c\} \}$

Define  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a)=a, f(b)=b, f(c)=c$ .

Define  $g: (Y, \sigma) \rightarrow (Z, \eta)$  by  $g(a)=c, g(b)=b, g(c)=a$ .

${}^*Ga C(X, \tau)=\{X, \phi, \{c\},\{b, c\}\}$ .

${}^*Ga C(Y, \sigma)=\{Y, \phi, \{c\},\{b, c\},\{a, c\}\}$ .

Clearly  $f$  and  $g$  are  ${}^*g\alpha$ -continuous.

Here  $\{a, c\}$  is a closed set in  $(Z, \eta)$ . But  $(gof)^{-1}(\{a, c\}) = \{a, c\}$  is not a  ${}^*g\alpha$ -closed set in  $(X, \tau)$ .

Therefore  $gof$  is not  ${}^*g\alpha$ -continuous.

We introduce the following definition.

**Definition 5.16:** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called  ${}^*g\alpha$ -irresolute if  $f^{-1}(V)$  is a  ${}^*g\alpha$ -closed set of  $(X, \tau)$  for every  ${}^*g\alpha$ -closed set of  $(Y, \sigma)$ .

**Theorem 5.17:** Every  ${}^*g\alpha$ -irresolute function is  ${}^*g\alpha$ -continuous.

**Proof:** Let  $V$  be a closed set of  $(Y, \sigma)$ . Since every closed set is  ${}^*g\alpha$ -closed set. Therefore  $V$  is  ${}^*g\alpha$ -closed set of  $(Y, \sigma)$ . Since  $f$  is  ${}^*g\alpha$ -irresolute  $f^{-1}(V)$  is  ${}^*g\alpha$ -closed in  $(X, \tau)$ . Therefore  $f$  is  ${}^*g\alpha$ -continuous.

The converse of the above theorem need not be true by the following example.

**Example 5.18:** Let  $X=\{a, b, c\}=Y$  with  $\tau=\{ X, \phi, \{b\},\{b, c\} \}$  and  $\sigma=\{Y, \phi, \{a, b\}\}$ .

Define  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a)=c, f(b)=a, f(c)=b$ .

${}^*Ga C(X, \tau)=\{X, \phi, \{a\},\{b, c\}\}$ .

${}^*Ga C(Y, \sigma) =\{Y, \phi, \{c\},\{b, c\},\{b, c\}\}$ .

Here  $f$  is  ${}^*g\alpha$ -continuous but  $f$  is not  ${}^*g\alpha$ -irresolute. Since  $\{a, c\}$  is  ${}^*g\alpha$ -closed set in  $(Y, \sigma)$  but  $f^{-1}(\{a, c\})=\{a, b\}$  is not  ${}^*g\alpha$ -closed set in  $(X, \tau)$ .

**Theorem 5.19:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  and  $g: (Y, \sigma) \rightarrow (Z, \eta)$  be any two functions. Then

(i)  $gof: (X, \tau) \rightarrow (Z, \eta)$  is  ${}^*g\alpha$ -continuous if  $g$  is continuous and  $f$  is  ${}^*g\alpha$ -continuous.

(ii)  $gof: (X, \tau) \rightarrow (Z, \eta)$  is  ${}^*g\alpha$ -irresolute if both  $g$  and  $f$  are  ${}^*g\alpha$ -irresolute.

(iii)  $gof: (X, \tau) \rightarrow (Z, \eta)$  is  ${}^*g\alpha$ -continuous if  $g$  is  ${}^*g\alpha$ -continuous and  $f$  is  ${}^*g\alpha$ -irresolute.

**Proof:**

(i) Let  $V$  be a closed set in  $(Z, \eta)$ . Since  $g$  is continuous,  $g^{-1}(V)$  is closed in  $(Y, \sigma)$ . Since  $f$  is  ${}^*g\alpha$ -continuous,  $f^{-1}(g^{-1}(V))=(gof)^{-1}(V)$  is  ${}^*g\alpha$ -closed in  $(X, \tau)$ . Therefore  $gof$  is  ${}^*g\alpha$ -continuous.

Similarly we can prove (ii) and (iii).

**Theorem 5.20:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a  ${}^*g\alpha$ -continuous (resp.  $g\alpha$ -continuous,  $\alpha g$ -continuous,  $g$ -continuous) map. If  $(X, \tau)$  is an  ${}^*T_{1/2}$  ( resp.  $T_c^{**}, {}^*T_c^{**}, {}^*T_{1/2}$  ) space, then  $f$  is continuous (  ${}^*g\alpha$ -continuous,  $g\alpha$ -continuous,  $g\alpha$ -continuous).

**Proof:** Let  $V$  be a closed set of  $(Y, \sigma)$ . Since  $f$  is  ${}^*g\alpha$ -continuous (resp.  $g\alpha$ -continuous,  $\alpha g$ -continuous,  $g$ -continuous),  $f^{-1}(V)$  is  ${}^*g\alpha$ -closed (resp.  $g\alpha$ -closed,  $\alpha g$ -closed,  $g$ -closed) in  $(X, \tau)$ . Since  $(X, \tau)$  is an  ${}^*T_{1/2}$  space ( resp.  $T_c^{**}, {}^*T_c^{**}, {}^*T_{1/2}$  space ),  $f^{-1}(V)$  is closed ( ${}^*g\alpha$ -closed) in  $(X, \tau)$ . Therefore  $f$  is continuous ( ${}^*g\alpha$ -continuous,  $g\alpha$ -continuous,  $g\alpha$ -continuous).

**Theorem 5.21:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a surjective,  $g\alpha$ -irresolute and a closed map. Then  $f(A)$  is  ${}^*g\alpha$ -closed set of  $(Y, \sigma)$  for every  ${}^*g\alpha$ -closed set  $A$  of  $(X, \tau)$ .

**Proof:** Let  $A$  be a  ${}^*g\alpha$ -closed set of  $(X, \tau)$ . Let  $U$  be a  $g\alpha$ -open set of  $(Y, \sigma)$  such that  $f(A) \subseteq U$ . Since  $f$  is surjective and  $g\alpha$ -irresolute,  $f^{-1}(U)$  is a  $g\alpha$ -open set of  $(X, \tau)$ . Since  $A \subseteq f^{-1}(U)$  and  $A$  is  ${}^*g\alpha$ -closed set of  $(X, \tau)$ ,  $cl(A) \subseteq f^{-1}(U)$ .

Then  $f(\text{cl}(A)) \subseteq f(f^{-1}(U)) = U$ . Since  $f$  is closed,  $f(\text{cl}(A)) = \text{cl}(f(\text{cl}(A)))$ . This implies  $\text{cl}(f(A)) \subseteq \text{cl}(f(\text{cl}(A))) = f(\text{cl}(A)) \subseteq U$ . Therefore  $f(A)$  is a  ${}^*g\alpha$ -closed set of  $(Y, \sigma)$ .

**Theorem 5.22:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a surjective,  ${}^*g\alpha$ -irresolute and a closed map. If  $(X, \tau)$  is an  ${}_{\alpha}T_{1/2}^{**}$  space, then  $(Y, \sigma)$  is also an  ${}_{\alpha}T_{1/2}^{**}$  space.

**Proof:** Let  $A$  be a  ${}^*g\alpha$ -closed set of  $(Y, \sigma)$ . Since  $f$  is  ${}^*g\alpha$ -irresolute,  $f^{-1}(A)$  is a  ${}^*g\alpha$ -closed set of  $(X, \tau)$ . Since  $(X, \tau)$  is an  ${}_{\alpha}T_{1/2}^{**}$  space,  $f^{-1}(A)$  is a closed set of  $(X, \tau)$ . Then  $f(f^{-1}(A)) = A$  is closed in  $(Y, \sigma)$ . Thus  $A$  is a closed set of  $(Y, \sigma)$ . Therefore  $(Y, \sigma)$  is a  ${}_{\alpha}T_{1/2}^{**}$  space.

**Definition 5.23:** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called pre- ${}^*g\alpha$ -closed if  $f(A)$  is a  ${}^*g\alpha$ -closed set of  $(Y, \sigma)$  for every  ${}^*g\alpha$ -closed set  $A$  of  $(X, \tau)$ .

**Theorem 5.24:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a surjective,  $g\sigma$ -irresolute and a pre- ${}^*g\alpha$ -closed map. If  $(X, \tau)$  is an  $T_c^{**}$  space, then  $(Y, \sigma)$  is also an  $T_c^{**}$  space.

**Proof:** Let  $A$  be a  $g\sigma$ -closed set of  $(Y, \sigma)$ . Since  $f$  is  $g\sigma$ -irresolute,  $f^{-1}(A)$  is a  $g\sigma$ -closed set in  $(X, \tau)$ . Since  $(X, \tau)$  is a  $T_c^{**}$  space,  $f^{-1}(A)$  is a  ${}^*g\alpha$ -closed set in  $(X, \tau)$ . Since  $f$  is pre- ${}^*g\alpha$ -closed map,  $f(f^{-1}(A))$  is  ${}^*g\alpha$ -closed in  $(Y, \sigma)$  for every  ${}^*g\alpha$ -closed set  $f^{-1}(A)$  of  $(X, \tau)$ . Since  $f$  is surjection,  $A = f(f^{-1}(A))$ . Thus  $A$  is a  ${}^*g\alpha$ -closed set of  $(Y, \sigma)$ . Therefore  $(Y, \sigma)$  is a  $T_c^{**}$  space.

**Theorem 5.25** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a surjective,  $\alpha g$ -irresolute and a pre- ${}^*g\alpha$ -closed map. If  $(X, \tau)$  is an  ${}_{\alpha}T_c^{**}$  space, then  $(Y, \sigma)$  is also an  ${}_{\alpha}T_c^{**}$  space.

**Proof:** Let  $A$  be a  $\alpha g$ -closed set of  $(Y, \sigma)$ . Since  $f$  is  $\alpha g$ -irresolute,  $f^{-1}(A)$  is a  $\alpha g$ -closed set in  $(X, \tau)$ . Since  $(X, \tau)$  is a  ${}_{\alpha}T_c^{**}$  space,  $f^{-1}(A)$  is a  ${}^*g\alpha$ -closed set in  $(X, \tau)$ . Since  $f$  is pre- ${}^*g\alpha$ -closed map,  $f(f^{-1}(A))$  is  ${}^*g\alpha$ -closed in  $(Y, \sigma)$  for every  ${}^*g\alpha$ -closed set  $f^{-1}(A)$  of  $(X, \tau)$ . Since  $f$  is surjection,  $A = f(f^{-1}(A))$ . Thus  $A$  is a  ${}^*g\alpha$ -closed set of  $(Y, \sigma)$ . Therefore  $(Y, \sigma)$  is a  ${}_{\alpha}T_c^{**}$  space.

**Theorem 5.26:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a surjective,  $g\sigma$ -irresolute and a pre- ${}^*g\alpha$ -closed map. If  $(X, \tau)$  is an  ${}^{**}T_{1/2}$  space, then  $(Y, \sigma)$  is also an  ${}^{**}T_{1/2}$  space.

**Proof:** Let  $A$  be a  $g$ -closed set of  $(Y, \sigma)$ . Since  $f$  is  $g\sigma$ -irresolute,  $f^{-1}(A)$  is a  $g$ -closed set in  $(X, \tau)$ . Since  $(X, \tau)$  is a  ${}^{**}T_{1/2}$  space,  $f^{-1}(A)$  is a  ${}^*g\alpha$ -closed set in  $(X, \tau)$ . Since  $f$  is pre- ${}^*g\alpha$ -closed map,  $f(f^{-1}(A))$  is  ${}^*g\alpha$ -closed in  $(Y, \sigma)$  for every  ${}^*g\alpha$ -closed set  $f^{-1}(A)$  of  $(X, \tau)$ . Since  $f$  is surjection,  $A = f(f^{-1}(A))$ . Thus  $A$  is a  ${}^*g\alpha$ -closed set of  $(Y, \sigma)$ . Therefore  $(Y, \sigma)$  is a  ${}^{**}T_{1/2}$  space.

## 6. ${}^*g\alpha$ -homeomorphism and their group structure

**Definition 6.1:** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is said to be  ${}^*g\alpha$ -open if the image  $f(U)$  is  ${}^*g\alpha$ -open in  $(Y, \sigma)$  for every open set  $U$  of  $(X, \tau)$ .

**Definition 6.2:** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is said to be  ${}^*g\alpha$ -closed if the image  $f(U)$  is  ${}^*g\alpha$ -closed in  $(Y, \sigma)$  for every closed set  $U$  of  $(X, \tau)$ .

**Definition 6.3:** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is said to be  ${}^*g\alpha c$ -homeomorphism (resp.  ${}^*g\alpha$ -homeomorphism) if  $f$  is bijective and  $f$  and  $f^{-1}$  are  ${}^*g\alpha$ -irresolute (resp.  ${}^*g\alpha$ -continuous).

### Theorem 6.4:

(i) Suppose that  $f$  is bijection. Then the following conditions are equivalent:

- (1)  $f$  is  ${}^*g\alpha$ -homeomorphism.
  - (2)  $f$  is  ${}^*g\alpha$ -open and  ${}^*g\alpha$ -continuous.
  - (3)  $f$  is  ${}^*g\alpha$ -closed and  ${}^*g\alpha$ -continuous.
- (ii) If  $f$  is a homeomorphism, then  $f$  and  $f^{-1}$  are  ${}^*g\alpha$ -irresolute.
- (iii) Every  ${}^*g\alpha c$ -homeomorphism is a  ${}^*g\alpha$ -homeomorphism.

### Proof:

(ii) First we prove that  $f^{-1}$  is  ${}^*g\alpha$ -irresolute. Let  $A$  be a  ${}^*g\alpha$ -closed set of  $(X, \tau)$ . To show  $(f^{-1})^{-1}(A) = f(A)$  is  ${}^*g\alpha$ -closed in  $(Y, \sigma)$ . Let  $U$  be a  $g\alpha$ -open set such that  $f(A) \subseteq U$ . Then  $A = (f^{-1}(f(A))) \subseteq f^{-1}(U)$  is  $g\alpha$ -open. Since  $A$  is  ${}^*g\alpha$ -closed,  $\text{cl}(A) \subseteq f^{-1}(U)$ . We have  $\text{cl}(f(A)) \subseteq f(\text{cl}(A)) \subseteq f(f^{-1}(U)) = U$  and so  $f(A)$  is  ${}^*g\alpha$ -closed. Thus  $f^{-1}$  is  ${}^*g\alpha$ -irresolute. Since  $f^{-1}$  is also a homeomorphism  $(f^{-1})^{-1} = f$  is  ${}^*g\alpha$ -irresolute.

(iii) Let  $f$  is bijective. Since  $f$  is  ${}^*g\alpha c$ - homeomorphism,  $f$  and  $f^{-1}$  are  ${}^*g\alpha$ -irresolute. Since every  ${}^*g\alpha$ -irresolute map is  ${}^*g\alpha$ -continuous, then  $f$  and  $f^{-1}$  are  ${}^*g\alpha$ -continuous. Therefore  $f$  is  ${}^*g\alpha$ - homeomorphism.

**Definition 6.5:** For a topological space  $(X, \tau)$  we define the following three collections of functions:

- (i)  ${}^*g\alpha ch(X, \tau) = \{f/ f: (X, \tau) \rightarrow (X, \tau) \text{ is a } {}^*g\alpha c\text{- homeomorphism}\}$ .
- (ii)  ${}^*g\alpha h(X, \tau) = \{f/ f: (X, \tau) \rightarrow (X, \tau) \text{ is a } {}^*g\alpha\text{- homeomorphism}\}$ .
- (iii)  $h(X, \tau) = \{f/ f: (X, \tau) \rightarrow (X, \tau) \text{ is a homeomorphism}\}$ .

**Corollary 6.6:** For a space  $(X, \tau)$  the following properties hold.

- (i)  $h(X, \tau) \subseteq {}^*g\alpha ch(X, \tau) \subseteq {}^*g\alpha h(X, \tau)$ .
- (ii) The set  ${}^*g\alpha ch(X, \tau)$  forms a group under composition of functions.
- (iii) The group  $h(X, \tau)$  is a subgroup of  ${}^*g\alpha ch(X, \tau)$ .
- (iv) If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is a  ${}^*g\alpha c$ - homeomorphism then it induces an isomorphism  $f_*: {}^*g\alpha ch(X, \tau) \rightarrow {}^*g\alpha ch(Y, \sigma)$ .

**Proof:**

- (i) These implications are obtained by theorem 6.4(ii), (iii).
- (ii) By theorem 5.19.
- (iii) By (i).
- (iv) We define  $f_*: {}^*g\alpha ch(X, \tau) \rightarrow {}^*g\alpha ch(Y, \sigma)$  by  $f_*(h) = f \circ h \circ f^{-1}$ . Then using 5.19 we have that  $f_*(h) \in {}^*g\alpha ch(Y, \sigma)$ . It is shown that  $f_*$  is the required group isomorphism.

**Remark 6.7:** The following example shown that the converse of the above theorem (iv) is not true.

**Example 6.8:** Let  $X = \{a, b, c\} = Y$  with  $\tau = \{X, \phi, \{a\}, \{b, c\}\}$  and  $\sigma = \{Y, \phi, \{a, b\}\}$ .

Define  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a)=c, f(b)=a, f(c)=b$ .

${}^*Ga C(X, \tau) = \{X, \phi, \{a\}, \{b, c\}\}$ .

${}^*Ga C(Y, \sigma) = \{Y, \phi, \{c\}, \{b, c\}, \{a, c\}\}$ .

Also define three functions  $h_a, h_b, h_c: (X, \tau) \rightarrow (X, \tau)$  by

$h_a(a)=a, h_a(b)=c, h_a(c)=b$

$h_b(a)=a, h_b(b)=b, h_b(c)=c$

$h_c(a)=b, h_c(b)=a, h_c(c)=c$

Then it is shown that  ${}^*g\alpha ch(X, \tau) = \{1_x, h_a\}$ ,  ${}^*g\alpha ch(Y, \sigma) = \{1_y, h_c\}$  and  $f_*: {}^*g\alpha ch(X, \tau) \rightarrow {}^*g\alpha ch(Y, \sigma)$  is an isomorphism such that  $f_*(h_a) = h_c$ . However  $f$  is not  ${}^*g\alpha c$ - homeomorphism.

## 7. EXAMPLES IN THE DIGITAL PLANE

In the digital plane, we investigate explicit forms of  $G\alpha O$ -kernel  $\alpha$ -kernel and of a subset. The digital line or the so called Khalimsky line is the set of the integers  $Z$ , equipped with the topology  $k$  having  $\{\{2n+1, 2n, 2n-1\} / n \in Z\}$  as a subbase. This is denoted by  $(Z, k)$ . Thus, a subset  $U$  is open in  $(Z, k)$  if and only if whenever  $x \in U$  is an even integer, then  $x-1, x+1 \in U$ . Let  $(Z^2, k^2)$  be the topological product of two digital lines  $(Z, k)$ , where  $Z^2 = Z \times Z$  and  $k^2 = k \times k$ . This space is called the digital plane in the present paper (cf. [5], [11], [12]). We note that for each point  $x \in Z^2$  there exists the smallest open set containing  $x$ , say  $U(x)$ . For the case of  $x = (2n+1, 2m+1)$ ,  $U(x) = \{2n+1\} \times \{2m+1\}$ ; for the case of  $x = (2n, 2m)$ ,  $U(x) = \{2n-1, 2n, 2n+1\} \times \{2m-1, 2m, 2m+1\}$ ; for the case of  $x = (2n, 2m+1)$ ,  $U(x) = \{2n-1, 2n, 2n+1\} \times \{2m+1\}$ ; for the case of  $x = (2n+1, 2m)$ ,  $U(x) = \{2n+1\} \times \{2m-1, 2m, 2m+1\}$ , where  $n, m \in Z$ . For a subset  $E$  of  $(Z^2, k^2)$ , we define the following three subsets as follows:  $E_F = \{x \in E / x \text{ is closed in } (Z^2, k^2)\}$ ;  $E_k^2 = \{x \in E / x \text{ is open in } (Z^2, k^2)\}$ ;  $E_{mix} = E \setminus (E_F \cup E_k^2)$ . Then it is shown that  $E_F = \{(2n, 2m) \in E / n, m \in Z\}$ ,  $E_k^2 = \{(2n+1, 2m+1) \in E / n, m \in Z\}$  and  $E_{mix} = \{(2n, 2m+1) \in E / n, m \in Z\} \cup \{(2n+1, 2m) \in E / n, m \in Z\}$ .

**Theorem 7.1:** Let  $A$  and  $E$  be subsets of  $(Z^2, k^2)$ .

- (i) If  $E$  is non - empty  $\alpha$ -closed set, then  $E_F \neq \phi$  [8].
- (ii) If  $E$  is  $\alpha$ - closed and  $E \subseteq B_{mix} \cup B_k^2$  holds for some subset  $B$  of  $(Z^2, k^2)$  then  $E = \phi$  [8].
- (iii) The set  $U(A_F) \cup A_{mix} \cup A_k^2$  is a  $g\alpha$ -open set containing  $A$ .

**Proof:**

(iii): We claim that  $A_{mix} \cup A_k^2$  is a  $g\alpha$ -open set. Let  $F$  be any non -empty  $\alpha$ - closed set such that  $F \subseteq A_{mix} \cup A_k^2$ . Then by (ii),  $F = \phi$ . Thus, we have that  $F \subseteq \alpha - \text{Int}(A_{mix} \cup A_k^2)$  then  $A_{mix} \cup A_k^2$  is  $g\alpha$ - open. But we know that  $U(A_F)$  is a open set. Then  $U(A_F) \cup A_{mix} \cup A_k^2$  is  $g\alpha$ -open by theorem 3.14. But  $A = A_F \cup A_{mix} \cup A_k^2$ .  $A \subseteq U(A_F) \cup A_{mix} \cup A_k^2$ . This implies that  $g\alpha$ -open set contains  $A$ .

**Theorem 7.2:** Let A be a subset of  $(Z^2, k^2)$ . The G $\alpha$ o– kernel of A and the  $\alpha$ -kernel of A are obtained precisely as follows:

- (i) G $\alpha$ o–ker (A) =  $U(A_F) \cup A_{mix} \cup A_k^2$ , where  $U(A_F) = \cup \{ U(x) \mid x \in A_F \}$ .
- (ii)  $\alpha$ -ker (A) =  $U(A)$ , where  $U(A) = \cup \{ U(x) \mid x \in A \}$ [8].

**Proof:**

(i): Let  $U_A = U(A_F) \cup A_{mix} \cup A_k^2$ . By Lemma 7.1 (iii), G $\alpha$ o - ker (A)  $\subseteq U_A$ .

To prove  $U_A \subseteq G\alpha o\text{-ker}(A)$ , it is claimed that (\*) if there exists a g $\alpha$ -open set V such that  $A \subseteq V \subseteq U_A$  then  $V = U_A$ . Indeed, let x be any point of  $U_A$ . There are three cases for the point x.

**Case (1):**  $x \in (U_A)_F$ . we note that  $(U_A)_F = (U(A_F))_F \cup (A_{mix} \cup A_k^2)_F = A_F$ .

Then we have that  $x \in A_F \subseteq A \subseteq V$ .

**Case (2):**  $x \in (U_A)_k^2$ . We note that

$$(U_A)_k^2 = (U(A_F))_k^2 \cup (A_{mix})_k^2 \cup (A_k^2)_k^2 = (U(A_F))_k^2 \cup A_k^2.$$

Firstly suppose that  $x \in U(A_F)$ . Then  $x \in U(y)$  for some  $y \in A_F$ . Since  $y \in A_F \subseteq A \subseteq V$  and V is g $\alpha$ -open, we have  $\{y\} \subseteq \alpha\text{-Int}(V)$ . Then  $U(y) \subseteq \alpha\text{-Int}(V)$ , because  $\alpha\text{-Int}(V)$  is  $\alpha$ -open. Thus we have that  $x \in V$ .

Secondly, suppose  $x \in A_k^2$ , then we have  $x \in V$ , because  $x \in A_k^2 \subseteq A \subseteq V$ .

**Case (3):**  $x \in (U_A)_{mix}$ . We note that

$$\begin{aligned} (U_A)_{mix} &= (U(A_F))_{mix} \cup (A_k^2)_{mix} \cup (A_{mix})_{mix} \\ &= (U(A_F))_{mix} \cup A_{mix} \end{aligned}$$

Firstly suppose that  $x \in U(A_F)$ . Then  $x \in U(y)$  for some  $y \in A_F$ . Then y be a  $\alpha$ -closed point since every closed point is  $\alpha$ -closed point. Since  $y \in A_F \subseteq A \subseteq V$ ,  $\{y\}$  is  $\alpha$ -closed and V is g $\alpha$  - open set, we have  $\{y\} \subseteq \alpha\text{-Int}(V)$ . Then  $U(y) \subseteq \alpha\text{-Int}(V)$  and so  $x \in V$ .

Secondly, suppose that  $x \in A_{mix}$ . Then  $x \in A_{mix} \subseteq A \subseteq V$  implies  $x \in V$ .

For all cases we assume that  $x \in U_A$  then we show that  $x \in V$ , then  $U_A \subseteq V$ . But we know that  $V \subseteq U_A$ . From the above cases we conclude that  $V = U_A$ . Thus we shown (\*).

Let G $\alpha$ o(A) be the family of all g $\alpha$ -open sets containing A. Then, we have that  $U_A \subseteq W$  for each  $W \in G\alpha o(A)$ , using (\*) above and properties that  $A \subseteq W \cap U_A \subseteq U_A$  and  $W \cap U_A$  is g $\alpha$  -open set. Hence, we show that  $U_A \subseteq \cap \{W \mid W \in G\alpha o(A)\} = G\alpha o\text{-ker}(A)$ .

That is  $U_A \subseteq G\alpha o\text{-ker}(A)$ . Therefore G $\alpha$ o–ker (A) =  $U_A$ .

**Theorem 7.3:** Let E be a subset of  $(Z^2, k^2)$ .

- (i) If E is a non-empty g $\alpha$ -closed set, then  $E_F \neq \phi$ .
- (ii) If E is g $\alpha$ -closed set and  $E \subseteq B_{mix} \cup B_k^2$  holds for some subset B of  $(Z^2, k^2)$ , then  $E = \phi$ .

**Proof:**

(i): We recall that a subset E is g $\alpha$ -closed if and only if  $\alpha cl(E) \subseteq \alpha\text{-ker}(E)$ . Let y be a point of E.

We consider the following three cases for the point y.

**Case 1:**  $y \in E_k^2$ . Let  $y = (2n+1, 2m+1)$  for some  $n, m \in Z$ . Then  $\alpha cl(y) = \{2n, 2n+1, 2n+2\} \times \{2m, 2m+1, 2m+2\} \subseteq \alpha cl(E) \subseteq \alpha\text{-ker}(E)$ . Thus there exists a point  $(2n, 2m) \in \alpha\text{-ker}(E)$ , say  $y_1 = (2n, 2m)$ . Using theorem 7.2(ii), we have that  $y_1 \in U(z)$  for some  $z \in E$ .

If  $z \in E_{mix}$ , say  $z = (2s+1, 2t)$  for some  $s, t \in Z$ , then  $U(z) = \{2s+1\} \times \{2t-1, 2t, 2t+1\}$  and  $y_1 \notin U(z)$ . This is a contradiction.

Next if  $z \in E_k^2$ , say  $z = (2s+1, 2t+1)$  for some  $s, t \in \mathbb{Z}$ , then  $U(z) = \{(2s+1, 2t+1)\}$  and  $y_1 \notin U(z)$ . This is also a contradiction.

Thus we have that  $z \in E_F$  and hence  $E_F \neq \emptyset$  for case 1.

**Case 2:**  $y \in E_{mix}$ . Let  $y = (2n+1, 2m)$  for some  $n, m \in \mathbb{Z}$ . Then  $\alpha \text{cl}(y) = \{2n, 2n+1, 2n+2\} \times \{2m\} \subseteq \alpha \text{cl}(E) \subseteq \alpha\text{-ker}(E)$ . Thus there exists a point  $(2n, 2m) \in \alpha\text{-ker}(E)$ , say  $y_1 = (2n, 2m)$ . Using theorem 7.2(ii), we have that  $y_1 \in U(z)$  for some  $z \in E$ .

If  $z \in E_{mix}$ , say  $z = (2s+1, 2t)$  for some  $s, t \in \mathbb{Z}$ , then  $U(z) = \{2s+1\} \times \{2t-1, 2t, 2t+1\}$  and  $y_1 \notin U(z)$ . This is a contradiction.

Next if  $z \in E_k^2$ , say  $z = (2s+1, 2t+1)$  for some  $s, t \in \mathbb{Z}$ , then  $U(z) = \{(2s+1, 2t+1)\}$  and  $y_1 \notin U(z)$ . This is also a contradiction.

Thus we have that  $z \in E_F$  and hence  $E_F \neq \emptyset$  for case 2.

**Case 3:**  $y \in E_F$ . Then  $E_F \neq \emptyset$ .

We shown that  $E_F \neq \emptyset$  for all cases.

(ii): Suppose that  $E \neq \emptyset$ . By (i) we have that  $E_F \neq \emptyset$ . It follows from assumption and definition that  $E_F \subseteq (B_{mix} \cup B_k^2)_F = \emptyset$ . We have a contradiction.

**Theorem 7.4:** Let  $A$  be a subset in  $(\mathbb{Z}^2, k^2)$ .

(i) If  $(\mathbb{Z}^2)_F \subseteq A$  holds, then  $A$  is  $^*g\alpha$ -closed.

(ii) If  $(\mathbb{Z}^2)_F \subseteq A$  holds and there exists a point  $x \in A_k^2$  such that  $\text{cl}\{x\} \subseteq A$ , then  $A$  is  $^*g\alpha$ -closed set which is not  $\alpha$ -closed.

**Proof:**

(i) Using theorem 7.2, we have  $G\alpha\text{-ker}(A) = U(A_F) = \mathbb{Z}^2$ . Then,  $A$  is  $^*g\alpha$ -closed set by theorem 3.21.

(ii) By (i),  $A$  is  $^*g\alpha$ -closed set. Since  $\{x\} \subseteq A_k^2 \subseteq A$  and  $\text{Int}(\text{cl}(\{x\})) = \{x\}$ , we have that  $\text{cl}(\{x\}) \subseteq \text{cl}(\text{Int}(\text{cl}(A)))$  and so  $\text{cl}(\{x\}) \subseteq \alpha \text{cl}(A)$ . Suppose that  $A$  is  $\alpha$ -closed. Then, we have that  $\text{cl}(\{x\}) \subseteq A$ . This is a contradiction.

**Example 7.5:** The converse of the theorem 7.3(i) is not true in general. A set  $A = \{x, y, z\}$  where  $x = (3, 3)$ ,  $y = (3, 2)$  and  $z = (4, 2)$  is not  $g\alpha$ -closed but  $A_F \neq \emptyset$ .
