### ABSTRACT

In this paper some properties of wg $\alpha$ -I-closed sets and wag-I-closed sets are studied.

**Keywords:** g $\alpha$ -I-closed, ag-I-closed, wg $\alpha$ -I-closed, wag-I-closed.

### 1. INTRODUCTION AND PRELIMINARIES

An ideal  $I$  on a topological space  $(X, \tau)$  is a non-empty collection of subsets of  $X$  which satisfies the following properties. (1)  $A \in I$  and  $B \subseteq A$  implies  $B \in I$ , (2)  $A \in I$  and  $B \in I$  implies  $A \cup B \in I$ . An ideal topological space is a topological space  $(X, \tau)$  with an ideal  $I$  on  $X$  and is denoted by  $(X, \tau, I)$ . For a subset  $A \subseteq X$ ,  $A^*(I, \tau) = \{x \in X: A \cap U \notin I \text{ for every } U \in \tau(X, x)\}$  is called the local function of  $A$  with respect to  $I$  and  $\tau$  [7]. We simply write  $A^*$  in case there is no chance for confusion. A kuratowski closure operator  $cl^*(\cdot)$  for a topology  $\tau^*(I, \tau)$  called the  $*$ -topology, finer than  $\tau$  is defined by  $cl^*(A) = A \cup A^*$  [11]. If  $A \subseteq X$ ,  $cl(A)$  and  $int(A)$  will respectively, denote the closure and interior of  $A$  in  $(X, \tau)$ .

**Definition: 1.1** A subset  $A$  of a topological space  $(X, \tau)$  is called

1.  $\alpha$ -closed [10], if  $cl(int(cl(A))) \subseteq A$
2.  $\alpha$ g-closed [5], if  $\alpha cl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$
3. g $\alpha$ -closed [5], if  $\alpha cl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\alpha$ -open in  $(X, \tau)$
4. wg $\alpha$ -closed [6], if  $\alpha cl(int(A)) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\alpha$ -open in  $(X, \tau)$ .
5. wag-closed [6], if  $\alpha cl(int(A)) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ .
6. g-closed [8], if  $cl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ .
7. gs-closed [1], if  $scl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ .
8. sg-closed [3], if  $scl(int(A)) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is semi open in  $(X, \tau)$
9.  $\beta$ -closed [10], if  $int(cl(int(A))) \subseteq A$

The complements of the above mentioned closed sets are called their respective open sets.

**Definition: 1.3** A subset  $A$  of an ideal topological spaces  $(X, \tau, I)$  is said to be

1.  $\alpha$ -I-closed [4], if  $cl(int^*(cl(A))) \subseteq A$
2. g $\alpha$ -I-closed [9], if  $\alpha I cl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\alpha$ -open in  $X$ .
3. ag-I-closed [9], if  $\alpha I cl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $X$ .

The complements of the above mentioned closed sets are called their respective open sets.

### 2. wg $\alpha$ I-closed and wagI-closed sets

**Definition: 2.1** A subset  $A$  of an Ideal topological space  $(X, \tau, I)$  is said to be

- 1) wg $\alpha$ I-closed set, if  $\alpha I cl(Int(A)) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\alpha$ -open in  $X$ .
- 2) wagI-closed set, if  $\alpha I cl(Int(A)) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $X$ .

**Proposition: 2.2** Every  $\alpha$ -I-closed set is wgaI-closed set but not conversely.

**Proof:** Assume that a subset A of  $(X, \tau, I)$  is  $\alpha$ -I-closed set. Let U be an  $\alpha$ -open set containing A. Then  $\alpha\text{Icl}(A) \subseteq U$  as A is  $\alpha$ -I-closed. So  $\alpha\text{Icl}(\text{Int}(A)) \subseteq \alpha\text{Icl}(A) \subseteq U$ . This implies that  $\alpha\text{Icl}(\text{Int}(A)) \subseteq U$ . Hence A is wgaI-closed.

**Example: 2.3** Let  $X = \{a, b, c\}$ ,  $\tau = \{\phi, \{a\}, X\}$  and  $I = \{\phi, \{c\}\}$ . Then  $A = \{c\}$  is a wgaI-closed but not  $\alpha$ -I-closed.

**Proposition: 2.4** Every g $\alpha$ -closed set is wgaI-closed set but not conversely.

**Proof:** Let A be a subset of  $(X, \tau)$  which is g $\alpha$ -closed and Let U be an  $\alpha$ -open set containing A. Since A is g $\alpha$ -closed,  $\alpha\text{cl}(A) \subseteq U$ ,  $\alpha\text{Icl}(A) \subseteq \alpha\text{cl}(A) \subseteq U$ . This implies that  $\alpha\text{Icl}(\text{Int}(A)) \subseteq \alpha\text{Icl}(A) \subseteq U$ . Hence A is wgaI-closed.

**Example: 2.5** Let  $X = \{a, b, c\}$ ,  $\tau = \{\phi, \{a, b\}, X\}$  and  $I = \{\phi, \{a\}\}$ . Then  $A = \{b\}$  is a wgaI-closed but not g $\alpha$ -closed.

**Proposition: 2.6** Every g $\alpha$ -I-closed set is wgaI-closed set but not conversely.

**Proof:** Assume that a subset A of  $(X, \tau, I)$  is g $\alpha$ -I-closed set. Let U be an  $\alpha$ -open set containing A. Therefore  $\alpha\text{Icl}(\text{Int}(A)) \subseteq \alpha\text{Icl}(A) \subseteq U$ , therefore A is wgaI-closed.

**Example: 2.7** Let  $X = \{a, b, c\}$ ,  $\tau = \{\phi, \{a, b\}, X\}$  and  $I = \{\phi, \{a\}\}$ . Then  $A = \{b\}$  is a Wg $\alpha$ I-closed but not g $\alpha$ -I-closed.

**Remark: 2.8** suppose  $I = \{\phi\}$ , then the notion of wgaI-closed and wagI-closed sets coincide with wga-closed and wag-closed set.

**Remark: 2.9** The following examples show that the concepts of g-closed and wgaI-closed sets are independent.

**Example: 2.10** Let  $X = \{a, b, c\}$ ,  $\tau = \{\phi, \{a, b\}, X\}$  and  $I = \{\phi, \{a\}\}$ . Then  $A = \{b\}$  is a wgaI-closed but not g-closed set.

**Example: 2.11** Let  $X = \{a, b, c\}$ ,  $\tau = \{\phi, \{a\}, X\}$  and  $I = \{\phi, \{c\}\}$ . Then  $A = \{a, b\}$  is a g-closed but not wgaI-closed.

**Remark: 2.12** The following examples show that the concepts of sg-closed and wgaI-closed sets are independent.

**Example: 2.13** Let  $X = \{a, b, c\}$ ,  $\tau = \{\phi, \{a, b\}, X\}$  and  $I = \{\phi, \{a\}\}$ . Then  $A = \{b\}$  is a wgaI-closed but not sg-closed.

**Example: 2.14** Let  $X = \{a, b, c\}$ ,  $\tau = \{\phi, \{a\}, \{b\}, \{a, b\}, X\}$  and  $I = \{\phi, \{a\}\}$ . Then  $A = \{b\}$  is a sg-closed but not wgaI-closed.

**Remark: 2.15** The following examples show that the concept of gs-closed and wgaI-closed sets is independent.

**Example: 2.16** Let  $X = \{a, b, c\}$ ,  $\tau = \{\phi, \{a\}, \{b\}, \{a, b\}, X\}$  and  $I = \{\phi, \{a\}\}$ . Then  $A = \{c\}$  is a gs-closed but not wgaI-closed.

**Example: 2.17** Let  $X = \{a, b, c\}$ ,  $\tau = \{\phi, \{a, b\}, X\}$  and  $I = \{\phi, \{a\}\}$ . Then  $A = \{a\}$  is a wgaI-closed but not gs-closed.

**Proposition: 2.18** Every  $\alpha$ -I-closed set is wagI-closed set but not conversely.

**Proof:** Assume that a subset A of  $(X, \tau, I)$  is  $\alpha$ -I-closed set. Let U be an  $\alpha$ -open set containing A. Then  $\alpha\text{Icl}(A) \subseteq U$ , as A is  $\alpha$ -I-closed. So  $\alpha\text{Icl}(\text{Int}(A)) \subseteq \alpha\text{Icl}(A) \subseteq U$ . This implies that  $\alpha\text{Icl}(\text{Int}(A)) \subseteq U$ . Hence A is wagI-closed.

**Example: 2.19** Let  $X = \{a, b, c\}$ ,  $\tau = \{\phi, \{a\}, X\}$  and  $I = \{\phi, \{a\}, \{b\}, \{a, b\}\}$ . Then  $A = \{a, b\}$  is a wagI-closed but not  $\alpha$ -I-closed.

**Proposition: 2.20** Every  $\alpha$ g-closed set is wagI-closed set but not conversely.

**Proof:** Assume that a subset A of  $(X, \tau)$  is  $\alpha$ g-closed set. Let U be an open set containing A. Then  $\alpha\text{cl}(A) \subseteq U$ , as A is  $\alpha$ g-closed. Since every  $\alpha$ -I-closed set is  $\alpha$ closed,  $\alpha\text{Icl}(\text{Int}(A)) \subseteq \alpha\text{Icl}(A) \subseteq U$ . Hence A is wagI-closed.

**Example: 2.21** Let  $X = \{a, b, c\}$ ,  $\tau = \{\phi, \{a, b\}, X\}$  and  $I = \{\phi, \{a\}\}$ . Then  $A = \{a\}$  is a wag-I-closed but not  $\alpha$ g-closed.

**Proposition: 2.22** Every  $\alpha$ gI-closed set is wagI-closed set but not conversely.

**Proof:** Assume that a subset  $A$  of  $(X, \tau, I)$  is  $\alpha$ gI-closed set. Let  $U$  be an open set containing  $A$ . Then  $\alpha Icl(A) \subseteq U$  and  $\alpha Icl(Int(A)) \subseteq \alpha Icl(A) \subseteq U$ . Hence  $A$  is wagI-closed.

**Example: 2.23** Let  $X = \{a, b, c\}$ ,  $\tau = \{\phi, \{a\}, \{a, c\}, X\}$  and  $I = \{\phi, \{a\}\}$ . Then  $A = \{c\}$  is a w $\alpha$ g-I-closed but not  $\alpha$ g-I-closed.

**Remark: 2.24** The following examples show that the concept of  $\beta$ -closed and wagI-closed sets are independent.

**Example: 2.25** Let  $X = \{a, b, c\}$ ,  $\tau = \{\phi, \{a\}, \{a, c\}, X\}$  and  $I = \{\phi, \{b\}\}$ . Then  $A = \{a, b\}$  is a wag-I-closed but not  $\beta$ -closed.

**Example: 2.26** Let  $X = \{a, b, c\}$ ,  $\tau = \{\phi, \{b\}, \{c\}, \{b, c\}, X\}$  and  $I = \{\phi, \{c\}\}$ . Then  $A = \{a\}$  is  $\beta$ -closed but not wag-I-closed.

**Remark: 2.27** The following examples show that the concepts of sg-closed and wagI-closed sets are independent.

**Example: 2.28** Let  $X = \{a, b, c\}$ ,  $\tau = \{\phi, \{a\}, \{a, c\}, X\}$  and  $I = \{\phi, \{a\}\}$ . Then  $A = \{a, b\}$  is a wag-I-closed but not sg-closed.

**Example: 2.29** Let  $X = \{a, b, c\}$ ,  $\tau = \{\phi, \{a\}, \{b\}, \{a, b\}, X\}$  and  $I = \{\phi, \{a\}\}$ . Then  $A = \{b\}$  is sg-closed but not wag-I-closed.

**Remark: 2.30** The following examples show that the concepts of gs-closed and wagI-closed sets are independent.

**Example: 2.31** Let  $X = \{a, b, c\}$ ,  $\tau = \{\phi, \{b\}, \{c\}, \{b, c\}, X\}$  and  $I = \{\phi, \{c\}\}$ . Then  $A = \{c\}$  is gs-closed but not wag-I-closed.

**Example: 2.32** Let  $X = \{a, b, c\}$ ,  $\tau = \{\phi, \{a, b\}, X\}$  and  $I = \{\phi, \{a\}\}$ . Then  $A = \{a\}$  is wag-I-closed but not gs-closed.

**Proposition: 2.33** Every g-closed set is wagI-closed set but not conversely.

**Proof:** Assume that a subset  $A$  of  $(X, \tau)$  is g-closed set. Let  $U$  be an open set containing  $A$ . Then  $cl(A) \subseteq U$ , as  $A$  is g-closed. Then  $\alpha cl(A) \subseteq cl(A) \subseteq U$ . Since every  $\alpha$ -I-closed set is  $\alpha$ -closed.  $\alpha Icl(A) \subseteq \alpha cl(A) \subseteq cl(A) \subseteq U$ . So  $\alpha Icl(Int(A)) \subseteq \alpha Icl(A) \subseteq U$ . Hence  $A$  is wagI-closed.

**Example: 2.34** Let  $X = \{a, b, c\}$ ,  $\tau = \{\phi, \{a\}, \{a, c\}, X\}$  and  $I = \{\phi, \{a\}\}$ . Then  $A = \{c\}$  is wag-I-closed but not in g-closed.

**Proposition: 2.35** Every g $\alpha$ I-closed set is wagI-closed set but not conversely.

**Proof:** Assume that a subset  $A$  of  $(X, \tau, I)$  is g $\alpha$ I-closed set. Let  $U$  be  $\alpha$ -open set containing  $A$ . From the above theorems,  $\alpha Icl(Int(A)) \subseteq U$ . Since every open set is  $\alpha$ -open. Hence  $A$  is wagI-closed.

**Example: 2.36** Let  $X = \{a, b, c\}$ ,  $\tau = \{\phi, \{a\}, X\}$  and  $I = \{\phi, \{a\}, \{b\}, \{a, b\}\}$ . Then  $A = \{a, c\}$  is wag-I-closed but not in g $\alpha$ I-closed.

**Proposition: 2.37** Every w $\alpha$ gI-closed set is wagI-closed set but not conversely.

**Proof.** Let  $A$  be a w $\alpha$ gI-closed set in  $(X, \tau, I)$  and Let  $U$  be an open set containing  $A$ . Since  $A$  is wagI-closed. So  $\alpha Icl(Int(A)) \subseteq U$ . Hence  $A$  is wagI-closed in  $(X, \tau, I)$ .

**Example: 2.38** Let  $X = \{a, b, c\}$ ,  $\tau = \{\phi, \{a\}, X\}$  and  $I = \{\phi, \{c\}\}$ . Then  $A = \{a, b\}$  is wag-I-closed but not in w $\alpha$ gI-closed.
