#### Abstract

Necessary and sufficient conditions are determined for a sum of polynomial con-EP matrices to be polynomial con-EP and it is shown that the sum and parallel sum of parallel summable polynomial con-EP matrices are polynomial con$E P$.

Keywords: EP matrix, polynomial matrix, Generalized inverse.
Ams classification: 15A09, 15A15, 15A57.

## INTRODUCTION

In this paper we shall study the question of when of polynomial conjugate EP (polynomial con-EP) matrices is polynomial con-EP. We give necessary and sufficient conditions for sum of polynomial con-EP matrices to be polynomial con-EP. We also show that sum and parallel sum of parallel summable (p.s) [7], polynomial con-EP matrices are polynomial con-EP. The results of this paper for polynomial con-EP matrices are analogous to that of EP matrices, studied in [4].

Throughout we shall deal with $n \times n$ complex polynomial matrices. An n-square matrix $A(\lambda)$ which is a polynomial in the scalar variable $\lambda$ from a field $C$ represented by $A(\lambda)=A_{m} \lambda^{m}+A_{m-1} \lambda^{m-1}+\ldots \ldots .+A_{1} \lambda+A_{0}$ where the leading coefficient $A_{m} \neq 0, A_{i} s$ are square matrices in $V_{n \times n}$ is defined a polynomial matrix. Let $\bar{A}, A^{T}, A^{*}$ and $A^{-}$ denote the conjugate, transpose, conjugate transpose and generalized inverse ( $A A^{-} A=A$ ) of $A$ respectively. $A^{\dagger}$ denotes the Moore-penrose inverse satisfying the following four equations: $\mathrm{AXA}=\mathrm{A}, \mathrm{XAX}=\mathrm{X},(\mathrm{AX})^{*}=\mathrm{AX}$ and $(X A)^{*}=X A$ of [7]. Any matrix $A$ is called polynomial con-EP if $R(A)=R\left(A^{T}\right)$ or $N(A)=N\left(A^{T}\right)$ or $A A^{\dagger}=A^{\dagger} A$ and is called polynomial con-EP, if $A$ is polynomial con-EP and $\operatorname{rk}(A)=r$, where $N(A), R(A)$ and $r k(A)$ denote the null space, range space and rank of A respectively[5]. Any two matrices $A$ and $B$ are said to be p.s. if $N(A+B) \subseteq N(B)$ and $N(A+B)^{*} \subseteq N(B)^{*}$ or equivalently $N(A+B) \subseteq N(A)$ and $N(A+B)^{*} \subseteq N(A)^{*}$. If $A$ and $B$ are p.s. then parallel sum of $A$ and $B$ denoted by $A: B$ and defined as $A: B=A(A+B)^{-} B$ of [7], if $A$ and $B$ are p.s. then the following hold [7]
(1) $\mathrm{A}: \mathrm{B}=\mathrm{B}: \mathrm{A}$
(2) $\mathrm{A}^{*}$ and $\mathrm{B}^{*}$ are p.s. and $(\mathrm{A}: \mathrm{B})^{*}=\mathrm{A}^{*}$ : $\mathrm{B}^{*}$
(3) If $U$ is nonsingular them $U A$ and $U B$ are p.s. and $U A: U B=U(A: B)$
(4) $R(A: B)=R(A) \cap R(B)$
(5) (A: B):E=A:(B:E) if all the parallel sum operations involved are defined.
S. Krishnamoorthy* and G. Manikandan**/ On Sums Of Polynomial Conjugate Ep Matrices / IJMA- 4(12), Dec.-2013.

Let $\mathrm{M}=\left[\begin{array}{ll}A & B \\ C & D\end{array}\right]$ be an $\mathrm{n} \times \mathrm{n}$ matrix. Then the schur complement of $A$ in $M$, denoted by $M / A$ is defined as D-CA ${ }^{-}$B [3]. For further properties of schur complements one may refer [1] and [2].

Theorem: 1 Let $A_{j}(i=1$ to $n)$ be polynomial con-EP matrices. Then $A=\sum_{i=1}^{n} A_{j}$ is polynomial con-EP if any one of the following equivalent conditions hold.
(i) $\quad \mathrm{N}(\mathrm{A}) \subseteq \mathrm{N}\left(\mathrm{A}_{\mathrm{i}}\right)$ for each i.
(ii)

$$
\mathrm{rk}\left[\begin{array}{c}
A_{1} \\
A_{2} \\
A_{3} \\
\cdot \\
\cdot \\
A_{n}
\end{array}\right]=\operatorname{rk}(A) .
$$

Proof: Equivalence of (i) and (ii) is already proved in [4] Since each $A_{i}$ is polynomial con-EP $N\left(A_{i}\right)=N\left(A_{i}^{T}\right)$ for each i. $N(A) \subseteq N\left(A_{i}\right)$ for each i implies $N(A) \subseteq \cap N\left(A_{i}\right)=\cap N\left(A_{i}^{T}\right)=\cap N\left(A_{i}^{T}\right)$ and $r k(A)=r k\left(A^{T}\right)$. Hence $N(A)=N\left(A^{T}\right)$. Thus $A$ is polynomial con-EP. Hence the Theorem.

Remark 1: In the above Theorem if $A$ is nonsingular then the conditions hold automatically and $A$ is polynomial conEP. But, it fails if we relax the condition on the $A_{i}$ 's.

Example 1: $\mathrm{A}=\left[\begin{array}{cc}\lambda^{2} & \lambda \\ \lambda & \mathrm{i}\end{array}\right]$ is polynomial con-EP, $\mathrm{B}=\left[\begin{array}{cc}\lambda^{3} & \lambda^{2}+\mathrm{i} \\ \lambda^{2} & \mathrm{i}\end{array}\right]$ is not polynomial con-EP then $\mathrm{A}+\mathrm{B}$ is not polynomial con-EP. However, $N(A+B) \subseteq N(A)$ and $\quad N(A+B) \subseteq N(B) ; r k\left[\begin{array}{l}A \\ B\end{array}\right]=r k(A+B)$.

Remark 2: If rank is additive, that is $\operatorname{rk}(A)=\sum \operatorname{rk}\left(A_{i}\right)$ then by Theorem 11 of [3], $R\left(A_{i}\right) \cap R\left(A_{j}\right)=\{0\}, i \neq j$, which implies $N(A) \subseteq N\left(A_{i}\right)$ for each $i$, hence $A$ is polynomial con-EP. That the conditions given in Theorem 1 are weaker than the condition of rank additivity can be seen by the following example.

Example 2: Let $\mathrm{A}=\left[\begin{array}{cc}\lambda^{2} & \lambda \\ \lambda & \mathrm{i}\end{array}\right]$ and $\mathrm{B}=\left[\begin{array}{cc}\lambda^{3} & \lambda^{2} \\ \lambda^{2} & \mathrm{i}\end{array}\right] \mathrm{A}, \mathrm{B}$ and $\mathrm{A}+\mathrm{B}$ are polynomial con- $\mathrm{EP}_{1}$ matrices. Conditions (i) and (ii) of Theorem 1 hold. But $\operatorname{rk}(\mathrm{A}+\mathrm{B}) \neq \operatorname{rk}(\mathrm{A})+\mathrm{rk}(\mathrm{B})$.

Theorem 2: Let $A_{i}(i=1$ to $n)$ be polynomial con- $E P_{1}$ matrices such that $\sum_{i \neq j}\left(A_{i}\right)^{*} A_{j}=0$. Then $A=\sum A_{i}$ is polynomial con-EP.

Proof: As in the proof of Theorem 2 in [6], Let $\sum_{i \neq j}\left(A_{i}\right)^{*} A_{j}=0$ implies $N(A) \subseteq N\left(A_{i}\right)$ for each $i$. Since each $A_{i}$ is polynomial con-EP, $A$ is polynomial con-EP. By theorem 1 hence the theorem

## Remark: 3

Theorem 2 fails if we relax the condition that $A_{i}^{\prime}$ 'S are polynomial con-EP. For instance
$\mathrm{A}=\left[\begin{array}{ccc}0 & 0 & 0 \\ 0 & \mathrm{i} \lambda^{2} & 0 \\ \mathrm{i} \lambda^{2} & 0 & 0\end{array}\right]$ and $\mathrm{B}=\left[\begin{array}{ccc}0 & \mathrm{i} \lambda^{2} & 0 \\ \mathrm{i} \lambda^{2} & 0 & 0 \\ 0 & \mathrm{i} \lambda^{2} & 0\end{array}\right]$ are not polynomial con-EP, then $\mathrm{A}+\mathrm{B}$ is also not polynomial conEP. However B ${ }^{*} \mathrm{~A}+\mathrm{A}{ }^{*} \mathrm{~B}=0$.

Remark: 4 The condition given in Theorem 2 implies those in Theorem 1, but not conversely. This can be seen by the following.

Example: 3 Let $A=\left[\begin{array}{cc}\lambda^{2} & \mathrm{i} \\ \mathrm{i} & \lambda\end{array}\right]$ and $\mathrm{B}=\left[\begin{array}{cc}\lambda^{2} & \lambda \\ \lambda & \mathrm{i}\end{array}\right]$. A and B are polynomial con-EP matrices. $\mathrm{N}(\mathrm{A}+\mathrm{B}) \subseteq \mathrm{N}(\mathrm{A})$ and $N(B)$.

But $A^{T} B+B^{T} A=\left[\begin{array}{cc}2 \lambda^{4}+2 \lambda i & \lambda^{3}+\lambda^{2}(i+1)-1 \\ \lambda^{3}+\lambda^{2}(i-1)-1 & 4 \lambda i\end{array}\right] \neq 0$.
Remark: 5 We note that the conditions given in Theorem 1 and Theorem 2 are only sufficient for the sum of polynomial con-EP matrices to be polynomial con-EP. But not necessary and this is illustrated in the following.

Example: 4 Let $\mathrm{A}=\left[\begin{array}{cc}\lambda^{2} & \mathrm{i} \\ -\mathrm{i} & 0\end{array}\right]$ and $\mathrm{B}=\left[\begin{array}{cc}\lambda^{2} & \lambda \\ \lambda & \mathrm{i}\end{array}\right]$. A and B are con- $\mathrm{EP}_{2}$. Neither the conditions in Theorem 1 nor in Theorem 2 hold. However $\mathrm{A}+\mathrm{B}$ is polynomial con-EP.

If $A$ and $B$ are polynomial con-EP matrices by Result 2.1 of [5]. We get $A{ }^{*}=K_{1} \bar{A}$, and $B{ }^{*}=K_{2} \bar{B}$, where $K_{1}$ and $K_{2}$ are nonsingular $n \times n$ matrices. If $K_{1}=K_{2}$, then $A+B$ is polynomial con-EP. If $\left(K_{1}-K_{2}\right)$ is nonsingular then the above conditions are also necessary for the sum of polynomial con-EP matrices to be polynomial con-EP. This is given in the following Theorem.

Theorem: 3 Let $A^{*}=K_{1} \bar{A}$ and $B^{*}=K_{2} \bar{B}$ such that $\left(K_{1}-K_{2}\right)$ is a nonsingular matrix. Then $A+B$ is polynomial con-EP if and any only if $N(A+B) \subseteq N(B)$.

Proof: $A^{*}=K_{1} \bar{A}$ and $B^{*}=K_{2} \bar{B}$ by Result 2.1 of [5] $A$ and $B$ are polynomial con-EP matrices. Since $N(A+B) \subseteq N(B)$ We can see that, $N(A+B) \subseteq N(A)$. Hence by Theorem 1, A+B is polynomial con-EP.

Conversely, let us assume that $A+B$ is polynomial con-EP, then by Theorem1 of [5], $A^{*}+B^{*}=(A+B)^{*}=G(\overline{A+B})$ for some $n \times n$ matrix $G$. Hence $K_{1} \bar{A}+K_{2} \bar{B}=G \overline{(A+B)}$. This implies $K \bar{A}=H \bar{B}$, where $K=K_{1}-G$ and $H=G$ $\mathrm{K}_{2}$.
$(\mathrm{K}+\mathrm{H}) \overline{\mathrm{A}}=\mathrm{H} \overline{(\mathrm{A}+\mathrm{B})} \quad$ and $\quad(\mathrm{K}+\mathrm{H}) \overline{\mathrm{B}}=\mathrm{K} \overline{(\mathrm{A}+\mathrm{B})} . \quad \mathrm{By}$ hypothesis, $\mathrm{K}+\mathrm{H}=\mathrm{K}_{1}-\mathrm{K}_{2} \quad$ is nonsingular. $N \overline{(A+B)} \subseteq N(H \overline{(A+B)}=N(K+H) \bar{A}=N(\bar{A})$, which implies $N(A+B) \subseteq N(A)$.

Similarly, $N \overline{(A+B)} \subseteq N(K \overline{(A+B)}=N(K+H) \bar{B}=N(\bar{B})$ implies $N(A+B) \subseteq N(B)$. Thus $A+B$ is polynomial con-EP implies, $N(A+B) \subseteq N(A)$ and $N(B)$. Hence the Theorem.

Remark 6: The condition ( $\mathrm{K}_{1}-\mathrm{K}_{2}$ ) to be nonsingular is essential in Theorem 3. This is illustrated in the following.
S. Krishnamoorthy* and G. Manikandan**/ On Sums Of Polynomial Conjugate Ep Matrices / IJMA- 4(12), Dec.-2013.

Example 5: $A=\left[\begin{array}{cc}\lambda^{2} & 0 \\ 0 & \mathrm{i} \lambda^{2}\end{array}\right]$ and $\mathrm{B}=\left[\begin{array}{cc}\mathrm{i} \lambda & 0 \\ 0 & 0\end{array}\right]$ are both symmetric, hence con-EP. Here $\mathrm{K}_{1}=\mathrm{K}_{2}$ and $A+B=\left[\begin{array}{cc}\mathrm{i}\left(\lambda^{2}+\lambda\right) & 0 \\ 0 & \mathrm{i} \lambda^{2}\end{array}\right]$ is polynomial con-EP. But $\mathrm{N}(\mathrm{A}+\mathrm{B}) \notin \mathrm{N}(\mathrm{A})$ or $\mathrm{N}(\mathrm{B})$. Thus Theorem 3 fails.

Lemma: 1 Let $A$ and $B$ be polynomial con-EP matrices. Then $A$ and $B$ are p.s. if and only if $N(A+B) \subseteq N(A)$.
Proof: If $A$ and $B$ are p.s. then $N(A+B) \subseteq N(A)$ follows from definition.
Conversely, if $N(A+B) \subseteq N(A)$ then $N(A+B) \subseteq N(B)$. Since $A$ and B are polynomial con-EP matrices by Theorem 1, $\mathrm{A}+\mathrm{B}$ is polynomial con-EP.

Hence $N(A+B)^{T}=N(A+B)=N(A) \cap N(B)=N\left(A^{T}\right) \cap N\left(B^{T}\right)$ which implies, $N(A+B)^{T}=N\left(A^{T}\right) \cap N\left(B^{T}\right)$
Therefore, $\mathrm{N}(\mathrm{A}+\mathrm{B})^{*} \subseteq \mathrm{~N}(\mathrm{~A})^{*}$ and $\mathrm{N}(\mathrm{A}+\mathrm{B})^{*} \subseteq \mathrm{~N}(\mathrm{~B})^{*}$. By hypothesis $\mathrm{N}(\mathrm{A}+\mathrm{B}) \subseteq \mathrm{N}(\mathrm{A})$. Hence A and $B$ are p.s.

In the following Theorem we show that sum and parallel sum of p.s. polynomial con-EP matrices is polynomial conEP.

Theorem: 4 If $A$ and $B$ are p.s. polynomial con-EP matrices then $A: B$ and $A+B$ are polynomial con-EP.
Proof: Since $A$ and $B$ are p.s. polynomial con-EP matrices, by Lemma $1, N(A+B) \subseteq N(A)$ and $N(A+B) \subseteq N(B)$. Now, the fact that $(A+B)$ is polynomial con-EP follows from Theorem 1.

$$
\text { Now, } \begin{aligned}
\mathrm{R}(\mathrm{~A}: \mathrm{B})^{*} & =\mathrm{R}\left(\mathrm{~A}^{*}: \mathrm{B}^{*}\right) & & (\mathrm{By}(2)) \\
& =\mathrm{R}\left(\mathrm{~A}^{*}\right) \cap \mathrm{R}\left(\mathrm{~B}^{*}\right) & & (\mathrm{By}(4)) \\
& =\mathrm{R}(\overline{\mathrm{~A}}) \cap \mathrm{R}(\overline{\mathrm{~B}}) & & \text { (A and B are polynomial con-EP) } \\
& =\mathrm{R}(\overline{\mathrm{~A}}: \overline{\mathrm{B}}) & & \text { (By (4)) } \\
& =\mathrm{R}(\overline{\mathrm{~A}}: \bar{B}) & &
\end{aligned}
$$

Which implies ( $\overline{\mathrm{A}: \mathrm{B}}$ ) is polynomial con-EP and hence A : B is polynomial con-EP. Thus A: B is polynomial con-EP whenever A and B are polynomial con-EP. Hence the Theorem.

Theorem: 5 Let $A$ be polynomial con- $E P_{r_{1}}$ and $B$ be polynomial con- $E P_{r_{2}}$ matrices of order $n$ such that $N(A+B) \subseteq N(B)$. Then there exists a $2 n \times 2 n$ polynomial con- $\mathrm{EP}_{\mathbf{r}}$ matrix M such that the schur complement of C in M is polynomial con-EP, where $\mathrm{r}=\mathrm{r}_{1}+\mathrm{r}_{2}$ and $\mathrm{C}=\mathrm{A}+\mathrm{B}$.

Proof: Since A is polynomial con- $E P_{r_{1}}$ and $B$ is polynomial con- $E P_{r_{2}}$, by Result 2.1 of [5] there exist unitary matrices $U$ and $V$ of order $n$ such that
$\mathrm{A}=\mathrm{U}^{\mathrm{T}} \mathrm{DU}$, and $\mathrm{B}=\mathrm{V}^{\mathrm{T}} \mathrm{EV}$, where
$\mathrm{D}=\left[\begin{array}{cc}\mathrm{H} & 0 \\ 0 & 0\end{array}\right]$, H is $\mathrm{r}_{1} \times \mathrm{r}_{1}$ nonsingular and
$E=\left[\begin{array}{ll}K & 0 \\ 0 & 0\end{array}\right], H$ is $r_{2} \times r_{2}$ nonsingular.
Let us define $P=\left[\begin{array}{ll}\mathrm{V} & 0 \\ \mathrm{U} & \mathrm{I}\end{array}\right], \mathrm{P}$ is nonsingular.

Now, $\quad \mathrm{P}^{\mathrm{T}}\left[\begin{array}{ll}\mathrm{E} & 0 \\ 0 & \mathrm{D}\end{array}\right] \mathrm{P}=\left[\begin{array}{cc}\mathrm{V}^{\mathrm{T}} & \mathrm{U}^{\mathrm{T}} \\ 0 & \mathrm{I}\end{array}\right]\left[\begin{array}{cc}\mathrm{E} & 0 \\ 0 & \mathrm{D}\end{array}\right]\left[\begin{array}{cc}\mathrm{V} & 0 \\ \mathrm{U} & \mathrm{I}\end{array}\right]$

$$
=\left[\begin{array}{cc}
\mathrm{V}^{\mathrm{T}} \mathrm{EV}+\mathrm{U}^{\mathrm{T}} \mathrm{DU} & \mathrm{U}^{\mathrm{T}} \mathrm{D} \\
\mathrm{DU} & \mathrm{D}
\end{array}\right]
$$

$$
=\left[\begin{array}{cc}
\mathrm{A}+\mathrm{B} & \mathrm{U}^{\mathrm{T}} \mathrm{D} \\
\mathrm{DU} & \mathrm{D}
\end{array}\right]
$$

$$
=\left[\begin{array}{cc}
\mathrm{C} & \mathrm{AU}^{*} \\
\overline{\mathrm{UA}} & \overline{\mathrm{U} A U^{*}}
\end{array}\right]=\mathrm{M} .
$$

$M$ is $2 n \times 2 n$ matrix and $r k(M)=r k(E)+r k(D)=r_{1}+r_{2}=r$.
Let us define $\mathrm{Q}=\left[\begin{array}{cc}\mathrm{T}_{\mathrm{n}} & 0 \\ \mathrm{UA}^{\dagger} \mathrm{A} & \mathrm{I}_{\mathrm{n}}\end{array}\right]$, Q is nonsingular.
Since A is polynomial con-EP $\mathrm{AA}^{\dagger}=\overline{\mathrm{A}^{\dagger} \mathrm{A}}$ and by Result 2.2 of [5] $\overline{\mathrm{U}} \mathrm{AU}^{*}$ is polynomial con-EP.
We can write $M$ as, $M=Q^{T}\left[\begin{array}{cc}B & 0 \\ 0 & \bar{U} A U^{*}\end{array}\right] Q$. Since $B$ and $\bar{U} A U^{*}$ are polynomial con-EP, $Q$ is nonsingular, $M$ is polynomial con-EP. Since M is of rank $\mathrm{r}, \mathrm{M}$ is polynomial con- $\mathrm{EP}_{\mathrm{r}}$. Thus we have proved the existence of the polynomial con- $E P_{r}$ matrix M . Now $\mathrm{C}=\mathrm{A}+\mathrm{B}$ is polynomial con-EP follows from Theorem 1. Since $\mathrm{N}(\mathrm{C}) \subseteq \mathrm{N}(\mathrm{A})=\mathrm{N}(\overline{\mathrm{U}} \mathrm{A})$ and $\mathrm{N}\left(\mathrm{C}^{*}\right) \subseteq \mathrm{N}\left(\mathrm{A}^{*}\right)=\mathrm{N}\left(\mathrm{AU}^{*}\right)^{*}$. By the Lemma in $[7], \mathrm{A}=\mathrm{AC}^{-} \mathrm{C}=\mathrm{CC}^{-} \mathrm{A}$ and $(\overline{\mathrm{U}} \mathrm{A}) \mathrm{C}^{-}\left(\mathrm{AU}^{*}\right)$ is invariant for all choice of $\mathrm{C}^{-}$. The schur complement of $\mathrm{C}^{\dagger}$ in M is,

$$
\begin{aligned}
\mathrm{M} / \mathrm{C} & =\overline{\mathrm{U}} A U^{*}-\overline{\mathrm{U}} A \mathrm{C}^{-} \mathrm{AU}^{*} \\
& =\overline{\mathrm{U}} A \mathrm{U}^{*}-\overline{\mathrm{U}}(\mathrm{~A}+\mathrm{B}) \mathrm{C}^{-}\left(\mathrm{A} \mathrm{U}^{*}\right)+\overline{\mathrm{U}} \mathrm{BC}^{-} \mathrm{AU}^{*} \\
& =\overline{\mathrm{U}} A \mathrm{U}^{*}-\overline{\mathrm{U}} C^{-} \mathrm{AU}^{*}+\overline{\mathrm{U}} \mathrm{UC}^{-} \mathrm{AU}^{*} \\
& =\overline{\mathrm{U}} A \mathrm{U}^{*}-\overline{\mathrm{U}} A \mathrm{U}^{*}+\overline{\mathrm{U} B C A U^{*}} \\
& =\overline{\mathrm{U}} B C^{-} A \mathrm{U}^{*} \\
& =\overline{\mathrm{U}}(\mathrm{~A}: B) \mathrm{U}^{*}
\end{aligned}
$$

Since A and B are polynomial con-EP, by Theorem 4, A:B is polynomial con-EP. By Result 2.2 of [5], $\mathrm{M} / \mathrm{C}=\overline{\mathrm{U}}(\mathrm{A}: \mathrm{B}) \mathrm{U}^{*}=\mathrm{P}(\mathrm{A}: B) \mathrm{P}^{\mathrm{T}}$, where $\mathrm{P}=\overline{\mathrm{U}}$ is unitary, is also polynomial con-EP. Hence the Theorem.

Remark: 7 In a special case if $A$ and $B$ are polynomial con-EP matrices such that $A+B=I_{n}$ then $A B=A: B=B: A=B A$ is polynomial con-EP. However this fails if we relax the conditions on $A$ and $B$. For instance, $A=\left[\begin{array}{cc}\lambda^{3} & 0 \\ 0 \lambda & 3\end{array}\right]$ is olynomial con- $\mathrm{EP}_{2}$ and $\mathrm{B}=\left[\begin{array}{cc}0 & 0 \\ \mathrm{i} \lambda & 1\end{array}\right]$ is not polynomial con-EP. Here $\mathrm{AB}=\mathrm{BA}$ is not polynomial con-EP, however $A+B=I_{2}$.
