ABSTRACT

In this paper, we investigate some basic properties such as connectedness, graph equations and diameters of total block-edge transformation graphs.

2010 Mathematics Subject Classification: 05C40, 05C12,

Keywords: line graph, block graph, jump graph, qlick graph, total block-edge transformation graphs  $G^{abc}$ .

---

1. INTRODUCTION

Throughout the paper we only consider simple graphs without isolated vertices. We refer to [8] for unexplained terminology and notation. A *block* of a graph is connected nontrivial graph having no cutvertices. Let  $G = (V, E)$  be a graph with block set  $U(G) = \{B_i; B_i \text{ is a block of } G\}$ . If a block  $B \in U(G)$  with the edge set  $\{e_1, e_2, \dots, e_r; r \geq 1\}$ , then we say that an edge  $e_i$  and a block  $B$  are incident with each other, where  $1 \leq i \leq r$ . The *line graph*  $L(G)$  of a graph  $G$  is the graph with vertex set as the edge set of  $G$  and two vertices of  $L(G)$  are adjacent whenever the corresponding edges in  $G$  have a vertex in common. The *jump graph*  $J(G)$  of a graph  $G$  is the graph whose the vertex set is the edge set of  $G$  and two vertices of  $J(G)$  are adjacent if and only if the corresponding edges in  $G$  are not adjacent in  $G$ . The *block graph*  $B(G)$  of a graph  $G$  is the graph whose vertices are the blocks of  $G$  and in which two vertices are adjacent whenever the corresponding blocks have a cutvertex in common.

The edges and blocks of  $G$  are called *members of*  $G$ . The *qlick graph*  $Q(G)$  of a graph  $G$  is the graph whose set of vertices is the union of the set of edges and blocks of  $G$  and in which two vertices are adjacent if and only if the corresponding member of  $G$  are adjacent or incident. This concept is introduced by V. R. Kulli [10] and was studied in [4, 5, 12].

In [16], Wu and Meng generalized the concept of total graph and introduced the total transformation graphs and defined as follows:

**Definition:** Let  $G = (V, E)$  be a graph, and  $x, y, z$  be three variables taking values  $+$  or  $-$ . The *transformation graph*  $G^{xyz}$  is the graph having  $V(G) \cup E(G)$  as the vertex set, and for  $\alpha, \beta \in V(G) \cup E(G)$ ,  $\alpha$  and  $\beta$  are adjacent in  $G^{xyz}$  if and only if one of the following holds:

- (i)  $\alpha, \beta \in V(G)$ .  $\alpha$  and  $\beta$  are adjacent in  $G$  if  $x = +$ ;  $\alpha$  and  $\beta$  are not adjacent in  $G$  if  $x = -$ .
- (ii)  $\alpha, \beta \in E(G)$ .  $\alpha$  and  $\beta$  are adjacent in  $G$  if  $y = +$ ;  $\alpha$  and  $\beta$  are not adjacent in  $G$  if  $y = -$ .
- (iii)  $\alpha \in V(G), \beta \in E(G)$ .  $\alpha$  and  $\beta$  are incident in  $G$  if  $z = +$ ;  $\alpha$  and  $\beta$  are not incident in  $G$  if  $z = -$ .

In [2], B. Basavanagoud et. al generalized the concept of total block graph and introduced the block-transformation graphs and defined as follows:

**Definition:** Let  $G = (V, E)$  be a graph with block set  $U(G)$ , and let  $\alpha, \beta, \gamma$  be three variables taking values 0 or 1. The *block-transformation graph*  $G^{\alpha\beta\gamma}$  is the graph having  $V(G) \cup U(G)$  as the vertex set. For any two vertices  $x$  and  $y \in V(G) \cup U(G)$  we define  $\alpha, \beta, \gamma$  as follows:

- (i) Suppose  $x, y$  are in  $V(G)$ .  $\alpha=1$  if  $x$  and  $y$  are adjacent in  $G$ .  $\alpha=0$  if  $x$  and  $y$  are not adjacent in  $G$ .
- (ii) Suppose  $x, y$  are in  $U(G)$ .  $\beta=1$  if  $x$  and  $y$  are adjacent in  $G$ .  $\beta=0$  if  $x$  and  $y$  are not adjacent in  $G$ .
- (iii)  $x \in V(G)$  and  $y \in U(G)$ .  $\gamma=1$  if  $x$  and  $y$  are incident with each other in  $G$ .  $\gamma=0$  if  $x$  and  $y$  are not incident with each other in  $G$ .

---

Corresponding Author: B. Basavanagoud\*

Inspired by the definition of total transformation graphs [16] and block-transformation graphs [2], Basavanagoud [1] generalized the concept of qlick graph and obtained the four pairs of transformation graphs namely total block-edge transformation graphs.

**Definition:** Let  $G = (V, E)$  be a graph with a block set  $U(G)$  and  $a, b, c$  be three variables taking values  $+$  or  $-$ . The total block-edge transformation graph  $G^{abc}$  is a graph whose vertex set is  $E(G) \cup U(G)$ , and two vertices  $x$  and  $y$  of  $G^{abc}$  are joined by an edge if and only if one of the following holds:

- (i)  $x, y \in E(G)$ .  $x$  and  $y$  are adjacent in  $G$  if  $a = +$  ;  $x$  and  $y$  are not adjacent in  $G$  if  $a = -$ .
- (ii)  $x, y \in U(G)$ .  $x$  and  $y$  are adjacent in  $G$  if  $b = +$  ;  $x$  and  $y$  are not adjacent in  $G$  if  $b = -$ .
- (iii)  $x \in E(G), y \in U(G)$ .  $x$  and  $y$  are incident with each other in  $G$  if  $c = +$ ;  $x$  and  $y$  are not incident with each other in  $G$  if  $c = -$ .

Thus, we obtain eight kinds of total block-edge transformation graphs, in which  $G^{+++}$  is the qlick graph  $Q(G)$  of  $G$  and  $G^{---}$  is its complement. Also  $G^{--+}$ ,  $G^{-+-}$  and  $G^{-++}$  are the complements of  $G^{++-}$ ,  $G^{+-+}$  and  $G^{+--}$  respectively. Some other graph valued functions were studied in [2, 3, 6, 7, 9, 11, 13, 14, 16]. The vertex  $e'_i$  ( $B'_i$ ) of  $G^{abc}$  corresponding to edge  $e_i$  (block  $B_i$ ) of  $G$  and is referred as edge (block)-vertex.

The following will be useful in the proof of our results.

**Remark 1.1:**  $L(G)$  is an induced subgraph of  $G^{+bc}$ .

**Remark 1.2:**  $J(G)$  is an induced subgraph of  $G^{-bc}$ .

**Remark 1.3:**  $B(G)$  is an induced subgraph of  $G^{a+c}$ .

**Remark 1.4:**  $\overline{B(G)}$  is an induced subgraph of  $G^{a-c}$ .

**Remark 1.5:** [7] If a disconnected graph  $G$  has no isolated vertices, then  $J(G)$  is connected.

**Theorem 1.1:** [8] If  $G$  is connected, then  $L(G)$  is connected.

**Theorem 1.2:** [8] If  $G$  is connected, then  $B(G)$  is connected.

**Theorem 1.3:** [17] Let  $G$  be a graph of size  $q \geq 1$ . Then  $J(G)$  is connected if and only if  $G$  contains no edge that is adjacent to every other edge of  $G$  unless  $G = K_4$  or  $C_4$ .

In this paper, we investigate some basic properties of these eight kinds of total block-edge transformation graphs.

## 2. CONNECTEDNESS OF $G^{abc}$

The first theorem is obvious from the notion of  $G^{abc}$ .

**Theorem 2.1:** For a given graph  $G$ ,  $G^{+++}$  is connected if and only if  $G$  is connected.

**Theorem 2.2:** For a given graph  $G$ ,  $G^{++-}$  is connected if and only if  $G \neq B_i \cup B_j$  is not a block, where  $B_i$  and  $B_j$  are blocks.

**Proof:** Suppose  $G \neq B_i \cup B_j$  is not a block. Then we consider the following cases:

**Case-1.** Suppose  $G$  is connected. Then it has at least two blocks. Hence by Theorem 1.2 and Remark 1.3,  $B(G)$  is a connected induced subgraph of  $G^{++-}$ , and also each edge-vertex  $e'_i$  in  $G^{++-}$  is adjacent to at least one block-vertex  $B'_x$ , where  $B_x$  is not incident with  $e_i$  in  $G$ . Therefore for every pair of vertices in  $G^{++-}$  are connected. Thus  $G^{++-}$  is connected.

**Case-2.** Suppose  $G$  is disconnected. Then it has at least three blocks. If  $e_i$  and  $e_j$  are adjacent edges in  $G$ , then  $e'_i$  and  $e'_j$  are adjacent in  $G^{++-}$ . If  $e_i$  and  $e_j$  are not adjacent edges in  $G$ , then  $e'_i$  and  $e'_j$  are connected through the block-vertex  $B'_x$ , where  $B_x$  is not incident with  $e_i$  and  $e_j$  in  $G$ . If  $B_x$  and  $B_y$  are adjacent blocks in  $G$ , then  $B'_x$  and  $B'_y$  are adjacent in  $G^{++-}$ . If  $B_x$  and  $B_y$  are not adjacent blocks in  $G$ , then  $B'_x$  and  $B'_y$  are connected through the edge-vertex  $e'_i$ , where  $e_i$  is not incident with  $B_x$  and  $B_y$  in  $G$ . If  $e$  is not incident with  $B$  in  $G$ , then  $e'$  and  $B'$  are adjacent in  $G^{++-}$ . If  $e$  is incident with  $B$  in  $G$ , then there exists not incident edge  $e_1$  and block  $B_1$  are not incident with  $B$  and  $e$  respectively such that  $e'$  and  $B'$  are connected in  $G^{++-}$ . Otherwise, there is a block  $B_1$  is not incident with  $e$ , and is adjacent to  $B$ , such that  $e'$  and  $B'$  are connected in  $G^{++-}$ . Since in such a case, there is a path between any two vertices of  $G^{++-}$ . Hence  $G^{++-}$  is connected.

Conversely, suppose  $G^{++-}$  is connected. If  $G$  is a block, then  $G^{++-} = L(G) \cup K_1$  is disconnected, a contradiction. If  $G = B_i \cup B_j$ , then  $G^{++-} = (L(B_i) + K_1) \cup (L(B_j) + K_1)$  is a disconnected graph, a contradiction.

**Theorem 2.3:**  $G^{++-}$  is connected for any graph  $G$ .

**Proof:** If  $G$  is connected, then by Remark 1.1 and Theorem 1.1,  $L(G)$  is a connected induced subgraph of  $G^{++-}$ , and each block-vertex  $B'_x$  in  $G^{++-}$  is adjacent to at least one edge-vertex  $e'_i$ , where  $e_i$  is incident with  $B_x$  in  $G$ . Thus  $G^{++-}$  is connected.

If  $G$  is disconnected, then  $\overline{B(G)}$  is a connected induced subgraph of  $G^{++-}$ , and each edge-vertex  $e'_i$  in  $G^{++-}$  is adjacent to exactly one block-vertex  $B'_x$ , where  $B_x$  is incident with  $e_i$  in  $G$ . Thus  $G^{++-}$  is connected.

**Theorem 2.4:** For a given graph  $G$ ,  $G^{+--}$  is connected if and only if  $G$  is not a block.

**Proof:** If  $G$  is a connected graph with at least two blocks, then by Remark 1.1 and Theorem 1.1,  $L(G)$  is a connected induced subgraph of  $G^{+--}$ , and in  $G^{+--}$ , each block-vertex  $B'_x$  is adjacent to at least one edge-vertex  $e'_i$ , where  $e_i$  is not incident with  $B_x$  in  $G$ . Thus  $G^{+--}$  is connected.

If  $G$  is disconnected, then  $\overline{B(G)}$  is a connected induced subgraph of  $G^{+--}$ , and in  $G^{+--}$ , each edge-vertex  $e'_i$  is adjacent to at least one block-vertex  $B'_x$ , where  $B_x$  is not incident with  $e_i$  in  $G$ . Thus  $G^{+--}$  is connected.

Conversely, if  $G$  is a block, then  $G^{+--} = L(G) \cup K_1$  is disconnected, a contradiction.

**Theorem 2.5:**  $G^{-++}$  is connected for any graph  $G$ .

**Proof:** If  $G$  is connected, then by Remark 1.3 and Theorem 1.2,  $B(G)$  is a connected induced subgraph of  $G^{-++}$ , and each edge-vertex  $e'_i$  in  $G^{-++}$  is adjacent to exactly one block-vertex  $B'_x$ , where  $B_x$  is incident with  $e_i$  in  $G$ . Thus  $G^{-++}$  is connected.

If  $G$  is disconnected, then by Remarks 1.2 and 1.5,  $J(G)$  is a connected induced subgraph of  $G^{-++}$ , and each block-vertex  $B'_x$  in  $G^{-++}$  is adjacent to at least one edge-vertex  $e'_i$ , where  $e_i$  is incident with  $B_x$  in  $G$ . Thus  $G^{-++}$  is connected.

**Theorem 2.6:** For a given graph  $G$ ,  $G^{-+-}$  is connected if and only if  $G$  is not a block.

**Proof:** If  $G$  is a connected graph with at least two blocks, then by Remark 1.3 and Theorem 1.2,  $B(G)$  is a connected induced subgraph of  $G^{-+-}$ , and in  $G^{-+-}$ , each edge-vertex  $e'_i$  is adjacent to at least one block-vertex  $B'_x$ , where  $B_x$  is not incident with  $e_i$  in  $G$ . Thus  $G^{-+-}$  is connected.

If  $G$  is disconnected, then by Remarks 1.2 and 1.5,  $J(G)$  is a connected induced subgraph of  $G^{-+-}$ , and in  $G^{-+-}$ , each block-vertex  $B'_x$  is adjacent to at least one edge-vertex  $e'_i$ , where  $e_i$  is not incident with  $B_x$  in  $G$ . Thus  $G^{-+-}$  is connected.

Conversely, if  $G$  is a block, then  $G^{-+-} = J(G) \cup K_1$  is disconnected, a contradiction.

**Theorem 2.7:** For a given graph  $G$ ,  $G^{--+}$  is connected if and only if  $G$  contains no block  $K_2$  that is adjacent to every other edge of  $G$ .

**Proof:** Suppose a graph  $G$  contains no block  $K_2$  that is adjacent to every other edge of  $G$ . If  $G$  is a block, then  $G^{--+} = J(G) + K_1$  is connected. If  $G$  has more than one block, then we consider the following two cases:

**Case-1.** Suppose  $G$  contains no edge that is adjacent to every other edge of  $G$ . Then by Remark 1.2 and Theorem 1.3,  $J(G)$  is a connected induced subgraph of  $G^{--+}$ , and each block-vertex  $B'_x$  is adjacent to at least one edge-vertex  $e'_i$  in  $G^{--+}$ , where  $e_i$  is incident with  $B_x$ . Thus  $G^{--+}$  is connected.

**Case-2.** Suppose  $G$  contains an edge  $e$  that is adjacent to every other edge of  $G$ . Then  $e$  is incident with a block  $B$  of size more than 2 and  $e'$  is isolated vertex in  $J(G)$  such that  $e, B', e'$  is a path in  $G^{--+}$ , where  $e_1$  is incident with  $B$ . Therefore every pair of edge-vertices are connected in  $G^{--+}$  and each block-vertices  $B'_x$  is adjacent to at least one edge-vertex  $e'_i$  in  $G^{--+}$ , where  $e_i$  is incident with  $B_x$  in  $G$ . Thus  $G^{--+}$  is connected.

Conversely, suppose  $G^{--+}$  is connected. Assume  $G$  contains a block  $K_2$ , say  $e$ , that is adjacent to every other edge of  $G$ . Then it is easy to see that  $G^{--+} = (G - e)^{--+} \cup K_2$  is disconnected, a contradiction.

**Theorem 2.8:** For a given graph  $G$ ,  $G^{---}$  is connected if and only if  $G \neq P_3$  is not a block.

**Proof:** Suppose  $G \neq P_3$  is not a block. We consider the following two cases:

**Case-1.** Suppose  $G$  contains no edge that is adjacent to every other edge of  $G$ . Then by Remark 1.2 and Theorem 1.3,  $J(G)$  is a connected induced subgraph of  $G^{---}$ , and each block-vertex  $B'_x$  is adjacent to at least one edge-vertex  $e'_i$  in  $G^{---}$ , where  $e_i$  is not incident with  $B_x$  in  $G$ . Thus  $G^{---}$  is connected.

**Case-2.** Suppose  $G$  contains an edge  $e$  that is adjacent to all other edge of  $G$ . Then by definition of  $G^{---}$ , each edge-vertex  $e'_i$  is adjacent to edge-vertex  $e'_k$  and to at least one block-vertex  $B'_j$ , where  $B_j$  is not incident with  $e_i$ , and  $e_k$  is not adjacent to  $e_i$  in  $G$ . And also each block-vertex  $B'_x$  is adjacent to block-vertex  $B_y$  and to at least one edge-vertex  $e'_i$ , where  $e_i$  is not incident with  $B_x$ , and  $B_y$  not adjacent to  $B_x$  in  $G$ . Hence there is a path between any two vertices of  $G^{---}$ . Therefore  $G^{---}$  is connected.

Conversely, suppose  $G^{---}$  is connected. If  $G$  is a block, then  $G^{---} = J(G) \cup K_1$  is disconnected, a contradiction. If  $G = P_3$ , then  $G^{---} = 2K_2$  is disconnected, a contradiction.

### 3. GRAPH EQUATIONS AND ITERATIONS OF $G^{abc}$

For a given graph operator  $\Phi$ , which graph is fixed under  $\Phi$ ?, that is  $\Phi(G) = G$ . It is well known in [15] that for a given graph  $G$ , the interchange graph  $G' = G$  if and only if  $G$  is a 2-regular graph.

For a given total block-edge transformation graph  $G^{abc}$ , we define the iteration of  $G^{abc}$  as follows:

(1).  $G^{(abc)^1} = G^{abc}$  (2).  $G^{(abc)^n} = [G^{(abc)^{n-1}}]^{abc}$  for  $n \geq 2$ .

**Theorem 3.1:** Let  $G$  be a connected graph. The graphs  $G$  and  $G^{ab+}$  are isomorphic if and only if  $G = K_2$ .

**Proof:** Suppose  $G^{ab+} = G$ . Assume  $G$  is a connected graph with  $p \geq 3$  vertices. We consider the following two cases:

**Case-1.** Suppose  $G$  is not a tree with  $p$  vertices. Then  $G$  has at least  $p$  edges and at least one block. Thus  $G^{ab+}$  has at least  $p + 1$  vertices. Hence  $G^{ab+} \neq G$ , a contradiction.

**Case-2.** Suppose  $G$  is a tree with  $p$  vertices. Then it has  $p - 1$  edges and  $p - 1$  blocks. Thus  $G^{ab+}$  has  $2p - 2$  vertices. Hence  $|V(G)| < |V(G^{ab+})|$ . Therefore  $G^{ab+} \neq G$ , a contradiction.

Conversely, suppose  $G = K_2$ . Then it is easy to see that  $G^{ab+} = K_2 = G$ .

**Corollary 3.2:** Let  $G$  be a connected graph. The graphs  $G$  and  $G^{(ab+)^n}$  are isomorphic if and only if  $G = K_2$ .

**Theorem 3.3:** The graphs  $G$  and  $G^{++-}$  are isomorphic if and only if  $G = 2K_2$ .

**Proof:** Suppose  $G^{++-} = G$ . Assume  $G \neq 2K_2$ . We consider the following two cases:

**Case-1.** Suppose  $G$  is a block. Then clearly  $G^{++-} = L(G) \cup K_1$  is disconnected. Thus  $G^{++-} \neq G$ , a contradiction.

**Case-2.** Suppose  $G$  has at least two blocks with  $q$  edges. Then  $G^{++-}$  has at least  $2q - 1$  edges. Hence the number of edges in  $G$  is less than that in  $G^{++-}$ . Thus  $G^{++-} \neq G$ , a contradiction.

Conversely, suppose  $G = 2K_2$ . Then it is easy to see that  $G^{++-} = 2K_2 = G$ .

**Corollary 3.4:** The graphs  $G$  and  $G^{(++-)^n}$  are isomorphic if and only if  $G = 2K_2$ .

**Theorem 3.5:** For any graph  $G$ ,  $G^{ab-} \neq G$ , where  $G^{ab-} \neq G^{++-}$ .

**Proof:** If  $G = K_2$ , then  $G^{ab-} = 2K_1 \neq G$ . We consider the following two cases:

**Case-1.** Suppose  $G \neq K_2$  is a connected graph. By the definitions of  $G^{ab+}$  and  $G^{ab-}$ , we have  $|V(G^{ab+})| = |V(G^{ab-})|$ . By proof of the Theorem 3.1, we have  $|V(G)| \neq |V(G^{ab+})|$ . Hence  $|V(G)| \neq |V(G^{ab-})|$ . Therefore  $G^{ab-} \neq G$ .

**Case-2.** Suppose  $G$  is a disconnected graph with  $q$  edges. Then  $G^{ab-}$  has at least  $q + 1$  edges. Hence  $|E(G)| \neq |E(G^{ab-})|$ . Therefore  $G^{ab-} \neq G$ . From all the above two cases, we have  $G^{ab-} \neq G$ .

**Corollary 3.6:** For any graph  $G$ ,  $G^{(ab-)^n} \neq G$ , where  $G^{(ab-)^n} \neq G^{(++-)^n}$ .

#### 4 DIAMETERS OF $G^{abc}$

The distance between two vertices  $v_i$  and  $v_j$ , denoted by  $d(v_i, v_j)$ , is the length of the shortest path between the vertices  $v_i$  and  $v_j$  in  $G$ . The shortest  $v_i - v_j$  path is often called *geodesic*. The *diameter* of a connected graph  $G$ , denoted by  $diam(G)$ , is the length of any longest geodesic.

In this section, we consider the diameters of  $G^{abc}$ .

**Theorem 4.1:** If  $G$  is a connected graph, then  $diam(G^{+++}) \leq diam(G) + 1$ .

**Proof:** Let  $G$  be a connected graph. We consider the following three cases:

**Case-1.** Assume  $G$  is a tree. Then it is easy to see that  $diam(G^{+++}) = diam(G)$ .

**Case-2.** Assume  $G$  is a cycle  $C_n$  for  $n \geq 3$ . Then  $G^{+++} = W_{n+1}$  and  $diam(G^{+++}) < diam(G) + 1$ .

**Case-3.** Assume  $G$  contains a cycle  $C_n$  for  $n \geq 3$ . Corresponding to cycle  $C_n$ ,  $W_{n+1}$  appears as subgraph in  $G^{+++}$ . Therefore  $diam(G^{+++}) \leq diam(G) + 1$ .

From all the above three cases, we have  $diam(G^{+++}) \leq diam(G) + 1$ .

**Theorem 4.2:** If  $G$  is neither a block nor a union of two blocks, then  $diam(G^{++-}) \leq 3$ .

**Proof:** Let  $e'_1, e'_2$  be the two edge-vertices of  $G^{++-}$ . If  $e_1$  and  $e_2$  are adjacent edges in  $G$ , then  $e'_1$  and  $e'_2$  are adjacent in  $G^{++-}$ . If  $e_1$  and  $e_2$  are not adjacent edges in  $G$ , then we have following cases:

**Case-1.** If  $e_1$  and  $e_2$  are incident with same block, then there exists a block  $B$  is incident with neither  $e_1$  nor  $e_2$  such that  $e'_1, B', e'_2$  is a path of length 2 in  $G^{++-}$ .

**Case-2.** If  $e_1$  and  $e_2$  are incident with different blocks  $B_1$  and  $B_2$  in  $G$  respectively, then we have the following subcases:

**Subcase-2.1.** If  $B_1$  and  $B_2$  are adjacent in  $G$ , then  $e'_1, B'_2, B'_1, e'_2$  is a path of length 3 in  $G^{++-}$ .

**Subcase-2.2.** If  $B_1$  and  $B_2$  are not adjacent in  $G$ , then there exists a block  $B_3$  is incident with neither  $e_1$  nor  $e_2$  such that  $e'_1, B'_3, e'_2$  is a path of length 2 in  $G^{++-}$ .

Let  $B'_1, B'_2$  be the two block-vertices of  $G^{++-}$ . If  $B_1$  and  $B_2$  are not adjacent blocks in  $G$ , then  $B'_1$  and  $B'_2$  are adjacent in  $G^{++-}$ . If  $B_1$  and  $B_2$  are adjacent blocks in  $G$ , then there exists an edge  $e$  is incident with neither  $B_1$  nor  $B_2$  such that  $B'_1, e', B'_2$  is a path in  $G^{++-}$  of length 2.

Let  $e'$  and  $B'$  be the edge-vertex and block-vertex of  $G^{++-}$  respectively. If  $e$  is not incident with  $B$  in  $G$ , then  $e'$  and  $B'$  are adjacent in  $G^{++-}$ . If  $e$  is incident with  $B$  in  $G$ , then there exists not incident edge  $e_1$  and block  $B_1$  are not incident with  $B$  and  $e$  respectively such that  $e', B'_1, e'_1, B'$  is a path in  $G^{++-}$  of length 3. Otherwise, there is a block  $B_1$  is not incident with  $e$ , and is adjacent to  $B$ , such that  $e', B'_1, B'$  is a path in  $G^{++-}$  of length 2.

**Theorem 4.3:** For a given graph  $G$ ,  $diam(G^{++-}) \leq 5$ .

**Proof:** Let  $e'_1, e'_2$  be the two edge-vertices of  $G^{++-}$ . If  $e_1$  and  $e_2$  are adjacent edges in  $G$ , then  $e'_1$  and  $e'_2$  are adjacent in  $G^{++-}$ . If  $e_1$  and  $e_2$  are not adjacent edges in  $G$ , then we have the following cases:

**Case-1.** If  $e_1$  and  $e_2$  are incident with same block  $B$ , then  $e'_1, B', e'_2$  is a path of length 2 in  $G^{++-}$ .

**Case-2.** If  $e_1$  and  $e_2$  are incident with different blocks  $B_1$  and  $B_2$  in  $G$  respectively, then we have the following subcases:

**Subcase-2.1.** If  $B_1$  and  $B_2$  are adjacent, then there exists two adjacent edges  $e_3$  in  $B_1$  and  $e_4$  in  $B_2$ , then  $e'_1, B'_1, e'_3, e'_4, B'_2, e'_2$  is a path of length at most 5 in  $G^{++-}$ .

**Subcase-2.2.** If  $B_1$  and  $B_2$  are not adjacent, then  $e'_1, B'_1, B'_2, e'_2$  is a path of length 3 in  $G^{++-}$ .

Let  $B'_1, B'_2$  be the two block-vertices of  $G^{+++}$ . If  $B_1$  and  $B_2$  are not adjacent blocks in  $G$ , then  $B'_1$  and  $B'_2$  are adjacent in  $G^{+++}$ . If  $B_1$  and  $B_2$  are adjacent blocks in  $G$ , then there exists two adjacent edges  $e_1$  in  $B_1$  and  $e_2$  in  $B_2$  such that  $B'_1, e'_1, e_2, B'_2$  is a path in  $G^{+++}$  of length 3.

Let  $e'_1$  and  $B'_2$  be the edge-vertex and block-vertex of  $G^{+++}$  respectively. If  $e_1$  is incident with  $B_2$  in  $G$ , then  $e'_1$  and  $B'_2$  are adjacent in  $G^{+++}$ . If  $e_1$  in  $B_1$ , is not incident with  $B_2$  in  $G$ , then we have the following cases:

**Case-1.** If  $B_1$  and  $B_2$  are adjacent in  $G$ , then there exists two adjacent edges  $e$  in  $B_1$  and  $e_2$  in  $B_2$  such that  $e'_1, B'_1, e', e_2, B'_2$  is a path in  $G^{+++}$  of length at most 4.

**Case-2.** If  $B_1$  and  $B_2$  are not adjacent in  $G$ , then  $e'_1, B'_1, B'_2$  is a path in  $G^{+++}$  of length 2.

**Theorem 4.4:** *If  $G$  is neither a block nor a connected graph with two blocks, then  $diam(G^{+--}) \leq 3$ .*

**Proof:** Let  $e'_1, e'_2$  be the two edge-vertices of  $G^{+--}$ . If  $e_1$  and  $e_2$  are adjacent edges in  $G$ , then  $e'_1$  and  $e'_2$  are adjacent in  $G^{+--}$ . If  $e_1$  and  $e_2$  are not adjacent edges in  $G$ , then we have following cases:

**Case-1.** If  $e_1$  and  $e_2$  are incident with same block, then there exists a block  $B$  is incident with neither  $e_1$  nor  $e_2$  such that  $e'_1, B', e_2$  is a path of length 2 in  $G^{+--}$ .

**Case-2.** If  $e_1$  and  $e_2$  are incident with different blocks  $B_1$  and  $B_2$  in  $G$  respectively, then we have the following subcases:

**Subcase-2.1.** If  $B_1$  and  $B_2$  are not adjacent in  $G$ , then  $e'_1, B'_2, B'_1, e'_2$  is a path of length 3 in  $G^{+--}$ .

**Subcase-2.2.** If  $B_1$  and  $B_2$  are adjacent in  $G$ , then there exists a block  $B$  is incident with neither  $e_1$  nor  $e_2$  such that  $e'_1, B', e_2$  is a path of length 2 in  $G^{+--}$ .

Let  $B'_1, B'_2$  be the two block-vertices of  $G^{+--}$ . If  $B_1$  and  $B_2$  are not adjacent blocks in  $G$ , then  $B'_1$  and  $B'_2$  are adjacent in  $G^{+--}$ . If  $B_1$  and  $B_2$  are adjacent blocks in  $G$ , then there exists an edge  $e$  is incident with neither  $B_1$  nor  $B_2$  such that  $B'_1, e', B'_2$  is a path in  $G^{+--}$  of length 2.

Let  $e'$  and  $B'$  be the edge-vertex and block-vertex of  $G^{+--}$  respectively. If  $e$  is not incident with  $B$  in  $G$ , then  $e'$  and  $B'$  are adjacent in  $G^{+--}$ . If  $e$  is incident with  $B$  in  $G$ , then we have the following cases:

**Case-1.** If there is a block  $B_1$  is not adjacent to  $B$ , and is not incident with  $e$ , then  $e', e'_1, B'$  is a path in  $G^{+--}$  of length 2.

**Case-2.** If there is an edge  $e_1$  is adjacent to  $e$ , and is not incident with  $B$ , then  $e', B'_1, B'$  is a path in  $G^{+--}$  of length 2.

**Lemma 4.5:** *If a connected graph  $G$  has two blocks, then  $diam(G^{+--}) \leq 5$ .*

**Proof:** Suppose  $G$  is a connected graph with two blocks  $B_1$  and  $B_2$  of size  $q_1$  and  $q_2$  respectively. Then  $K_{1,q_1}$  and  $K_{1,q_2}$  are two edge-disjoint subgraphs of  $G^{+--}$ . And there exists at least one edge  $e'$  in  $G^{+--}$  is incident with exactly one pendant vertex of  $K_{1,q_1}$  and  $K_{1,q_2}$ . It is easy that see that the diameter of star is at most 2.

Hence  $diam(G^{+--}) = diam(K_{1,q_1}) + diam(K_{1,q_2}) + 1 \leq 2 + 2 + 1 = 5$ .

**Theorem 4.6:** *For a given graph  $G$ ,  $diam(G^{-++}) \leq 3$ .*

**Proof:** Let  $e'_1, e'_2$  be the two edge-vertices of  $G^{-++}$ . If  $e_1$  and  $e_2$  are not adjacent edges in  $G$ , then  $e'_1$  and  $e'_2$  are adjacent in  $G^{-++}$ . If  $e_1$  and  $e_2$  are adjacent edges in  $G$ , then we have the following cases:

**Case-1.** If there is an edge  $e$  is not adjacent to both  $e_1$  and  $e_2$  in  $G$ , then  $e'_1, e', e'_2$  is a path in  $G^{-++}$  of length 2.

**Case-2.** If  $e_1$  and  $e_2$  are incident with same block  $B$ , then  $e'_1, B', e'_2$  is a path of length 2 in  $G^{-++}$ .

**Case-3.** If  $e_1$  and  $e_2$  are incident with different blocks  $B_1$  and  $B_2$  respectively, then  $e'_1, B'_1, B'_2, e'_2$  is a path of length 3 in  $G^{-++}$ .

Let  $B'_1, B'_2$  be the two block-vertices of  $G^{-++}$ . If  $B_1$  and  $B_2$  are adjacent blocks in  $G$ , then  $B'_1$  and  $B'_2$  are adjacent in  $G^{-++}$ . If  $B_1$  and  $B_2$  are not adjacent blocks in  $G$ , then we have two cases:

**Case-1.** If there is a block  $B$  is adjacent to both  $B_1$  and  $B_2$  in  $G$ , then  $B'_1, B', B'_2$  is a path in  $G^{-++}$  of length 2.

**Case-2.** If there are two not adjacent edges  $e_1$  in  $B_1$  and  $e_2$  in  $B_2$ , then  $B'_1, e'_1, e'_2, B'_2$  is a path in  $G^{-++}$  of length 3.

Let  $e'$  and  $B'$  be the edge-vertex and block-vertex of  $G^{-++}$  respectively. If  $e$  is incident with  $B$  in  $G$ , then  $e'$  and  $B'$  are adjacent in  $G^{-++}$ . If  $e$  is not incident with  $B$  in  $G$ , then we consider the following two cases:

**Case-1.** If there is a block  $B_1$  is incident with  $e$ , and is adjacent to  $B$ , then  $e', B'_1, B'$  is a path in  $G^{-++}$  of length 2.

**Case-2.** If there is an edge  $e_1$  is incident with  $B$ , and is not adjacent to  $e$ , then  $e', e'_1, b'$  is a path in  $G^{-++}$  of length 2.

**Theorem 4.7:** *If a graph  $G$  is not a block, then  $\text{diam}(G^{-+-}) \leq 3$ .*

**Proof:** Let  $e'_1, e'_2$  be the two edge-vertices of  $G^{-+-}$ . If  $e_1$  and  $e_2$  are not adjacent edges in  $G$ , then  $e'_1$  and  $e'_2$  are adjacent in  $G^{-+-}$ . If  $e_1$  and  $e_2$  are adjacent edges in  $G$ , then we have one of the following case:

**Case-1.** If  $e_1$  and  $e_2$  are incident with same block, then there exists a block  $B$  is incident with neither  $e_1$  nor  $e_2$  such that  $e'_1, B', e'_2$  is a path of length 2 in  $G^{-+-}$ .

**Case-2.** If  $e_1$  and  $e_2$  are incident with different blocks  $B_1$  and  $B_2$  respectively in  $G$ , then  $e'_1, B'_2, B'_1, e'_2$  is a path in  $G^{-+-}$  of length 3.

Let  $B'_1, B'_2$  be two block-vertices of  $G^{-+-}$ . If  $B_1$  and  $B_2$  are adjacent in  $G$ , then  $B'_1$  and  $B'_2$  are adjacent in  $G^{-+-}$ . If  $B_1$  and  $B_2$  are not adjacent in  $G$ , then there exists two not adjacent edges  $e_1$  and  $e_2$  are incident with  $B_1$  and  $B_2$  respectively such that  $B'_1, e'_1, e'_2, B'_2$  is a path of length 3 in  $G^{-+-}$ . Otherwise, there is an edge  $e$  is incident with neither  $B_1$  nor  $B_2$ , then  $B'_1, e', B'_2$  is a path of length 2 in  $G^{-+-}$ .

Let  $e'$  and  $B'$  be the edge-vertex and block-vertex of  $G^{-+-}$  respectively. If  $e$  is not incident with  $B$  in  $G$ , then  $e'$  and  $B'$  are adjacent in  $G^{-+-}$ . If  $e$  is incident with  $B$  in  $G$ , then we have the following cases:

**Case-1.** If there is an edge  $e_1$  is incident with  $B$ , and is not adjacent to edge  $e$  in  $G$ , then  $e', e'_1, B'$  is a path in  $G^{-+-}$  of length 2.

**Case-2.** If there is a block  $B_1$  which is incident with  $B$ , and is not adjacent to an edge  $e$ , then  $e', B'_2, B'$  is a path of length 2 in  $G^{-+-}$ .

**Theorem 4.8:** *If a graph  $G$  contains no block  $K_2$  that is adjacent to other edge, then  $\text{diam}(G^{-++}) \leq 4$ .*

**Proof:** Let  $e'_1, e'_2$  be the two edge-vertices of  $G^{-++}$ . If  $e_1$  and  $e_2$  are not adjacent edges in  $G$ , then  $e'_1$  and  $e'_2$  are adjacent in  $G^{-++}$ . If  $e_1$  and  $e_2$  are adjacent edges in  $G$ , then we have one of the following case:

**Case-1.** If  $e_1$  and  $e_2$  are incident with same block  $B$ , then  $e'_1, B', e'_2$  is a path of length 2 in  $G^{-++}$ .

**Case-2.** If  $e_1$  and  $e_2$  are incident with different blocks  $B_1$  and  $B_2$  respectively, then we have the following subcases:

**Subcase-2.1.** If there is an edge  $e$  which is adjacent to neither  $e_1$  nor  $e_2$  in  $G$ , then  $e'_1, e', e'_2$  is a path in  $G^{-++}$  of length 2.

**Subcase-2.2.** If there is an edge  $e$  which is incident with  $B_2$ , and is not adjacent to  $e_1$ , then  $e'_1, e', B'_2, e'_2$  is a path in  $G^{-++}$  of length 3.

**Subcase-2.3.** If there are two not adjacent edges  $e_3$  and  $e_4$ , where  $e_3$  and  $e_4$  are not adjacent to  $e_1$  and  $e_2$  respectively, then  $e'_1, e'_3, e'_4, e'_2$  is a path in  $G^{-++}$  of length 3.

Let  $B'_1, B'_2$  be the two block-vertices of  $G^{-++}$ . If  $B_1$  and  $B_2$  are not adjacent blocks in  $G$ , then  $B'_1$  and  $B'_2$  are adjacent in  $G^{-++}$ . If  $B_1$  and  $B_2$  are adjacent blocks in  $G$  and are incident with  $e_1$  and  $e_2$  respectively, then we have the following cases:

**Case-1.** If  $e_1$  and  $e_2$  are not adjacent in  $G$ , then  $B'_1, e'_1, e'_2, B'_2$  is a path of length 3 in  $G^{-++}$ . Otherwise, there is an edge  $e$  is not adjacent to  $e_1$  and  $e_2$  such that  $B'_1, e'_1, e', e'_2, B'_2$  is a path of length 4 in  $G^{-++}$ .

**Case-2.** If there is a block  $B$  is adjacent to neither  $B_1$  nor  $B_2$  in  $G$ , then  $B'_1, B', B'_2$  is a path of length 2 in  $G^{-++}$ . Otherwise, there are two not adjacent blocks  $B_3$  and  $B_4$ , are not adjacent to  $B_2$  and  $B_1$  respectively such that  $B'_1, B'_4, B'_3, B'_2$  is a path in  $G^{-++}$  of length 3.

Let  $e'_1$  and  $B'_2$  be the edge-vertex and block-vertex of  $G^{--+}$  respectively. If  $e_1$  is incident with  $B_2$  in  $G$ , then  $e'_1$  and  $B'_2$  are adjacent in  $G^{--+}$ . If  $e_1$  is not incident with  $B_2$  in  $G$ , then we have the following cases:

**Case-1.** If there is an edge  $e_2$  is incident with  $B_2$ , where  $e_2$  is not adjacent to  $e_1$  in  $G$ , then  $B'_2, e'_2, e'_1$  is a path in  $G^{--+}$  of length 2.

**Case-2.** If there are two not adjacent edges  $e_{2x}$  and  $e_{1x}$ , where  $e_{2x}$  and  $e_{1x}$  are incident with  $B_1$  and  $B_2$  respectively, and  $e_1$  is adjacent to  $e_{2x}$  and  $e_{1x}$ , then  $B'_2, e'_{2x}, e'_{1x}, B'_1, e'_1$  is a path in  $G^{--+}$  of length 4.

**Case-3.** If there is an edge  $e_3$  is not adjacent to both  $e_1$  and  $e_2$ , where  $e_1$  in  $B_1$  and  $e_2$  in  $B_2$ , then  $B'_2, e'_2, e'_3, e'_1$  is a path in  $G^{--+}$  of length 3.

**Theorem 4.9:** *If a graph  $G \neq P_3$  is not a block, then  $\text{diam}(G^{---}) \leq 4$ .*

**Proof:** Let  $e'_1, e'_2$  be the two edge-vertices of  $G^{---}$ . If  $e_1$  and  $e_2$  are not adjacent edges in  $G$ , then  $e'_1$  and  $e'_2$  are adjacent in  $G^{---}$ . If  $e_1$  and  $e_2$  are adjacent edges in  $G$ , then we have one of the following case:

**Case-1.** If  $e_1$  and  $e_2$  are incident with same block, then there exists a block  $B$  is incident with neither  $e_1$  nor  $e_2$  such that  $e'_1, B', e'_2$  is a path of length 2 in  $G^{---}$ .

**Case-2.** If  $e_1$  and  $e_2$  are incident with different blocks  $B_1$  and  $B_2$  respectively in  $G$ , then we have the following subcases:

**Subcase-2.1.** If there is a block  $B$  which is incident with neither  $e_1$  nor  $e_2$  in  $G$ , then  $e'_1, B', e'_2$  is a path in  $G^{---}$  of length 2.

**Subcase-2.2.** If there is an edge  $e$  is incident with block  $B_2$ , and is not adjacent to  $e_1$ , then  $e'_2, B'_1, e', e'_1$  is a path in  $G^{---}$  of length 3.

**Subcase-2.3.** If there is an edge  $e_3$  which is adjacent to neither  $e_1$  nor  $e_2$ , then  $e'_1, e'_3, e'_2$  is a path in  $G^{---}$  of length 2.

Let  $B'_1, B'_2$  be two block-vertices of  $G^{---}$ . If  $B_1$  and  $B_2$  are not adjacent blocks in  $G$ , then  $B'_1$  and  $B'_2$  are adjacent in  $G^{---}$ . If  $B_1$  and  $B_2$  are adjacent blocks in  $G$ , then we have the following cases:

**Case-1.** If there is an edge  $e$  is incident with neither  $B_1$  nor  $B_2$ , then  $B'_1, e', B'_2$  is a path of length 2 in  $G^{---}$ .

**Case-2.** If there are two not adjacent edges  $e_1$  and  $e_2$  are incident with  $B_1$  and  $B_2$  respectively, then  $B'_1, e'_2, e'_1, B'_2$  is a path of length 3 in  $G^{---}$ .

Let  $e'$  and  $B'$  be the edge-vertex and block-vertex of  $G^{---}$  respectively. If  $e$  is not incident with  $B$  in  $G$ , then  $e'$  and  $B'$  are adjacent in  $G^{---}$ . If  $e$  is incident with  $B$  in  $G$ , then we have the following cases:

**Case-1.** If there is an edge  $e_1$  is not incident with  $B$ , and is not adjacent to edge  $e$  in  $G$ , then  $e', e'_1, B'$  is a path in  $G^{---}$  of length 2.

**Case-2.** If there are not incident edge  $e_2$  and block  $B_3$ , where  $e_2$  is not incident with  $B$ , and  $B_3$  is not incident to  $e$ , then  $e', B'_3, e'_2, B'$  is a path of length 3 in  $G^{---}$ .

**Case-3.** If there is an edge  $e_1$  which is incident with  $B_1$ , and is not adjacent to an edge  $e_2$ , where  $e_2$  is incident with  $B$ , then  $B', e'_1, e'_2, B'_1, e'$  is a path of length 4 in  $G^{---}$ .
