#### Abstract

In this paper, we made an attempt to study the algebraic nature of intuitionistic fuzzy subbigroup of a bigroup.

2000 AMS Subject classification: 03F55, 06D72, 08A72.
KeyWords: Bigroup, fuzzy subset, intuitionistic fuzzy subset, fuzzy subbigroup, intuitionistic fuzzy subbigroup, Product.

## INTRODUCTION

In 1965, the fuzzy subset was introduced by L.A.Zadeh [10], after that several researchers explored on the generalization of the concept of fuzzy sets. The concept of intuitionistic fuzzy subset was introduced by K.T.Atanassov [2, 3], as a generalization of the notion of fuzzy set. The notion of fuzzy subgroups was introduced by Azriel Rosenfeld [4]. Palaniappan.N \& K.Arjunan [7] defined the intuitionistic fuzzy subgroups of a group. In this paper, we introduce the some theorems in intuitionistic fuzzy subbigroup of a bigroup.

## 1. PRELIMINARIES

1.1 Definition: A set $(G,+, \bullet)$ with two binary operations + and $\bullet$ is called a bigroup if there exist two proper subsets $\mathrm{G}_{1}$ and $\mathrm{G}_{2}$ of G such that (i) $\mathrm{G}=\mathrm{G}_{1} \cup \mathrm{G}_{2}\left(\right.$ ii) $\left(\mathrm{G}_{1},+\right.$ ) is a group (iii) $\left(\mathrm{G}_{2}, \bullet\right)$ is a group.
1.2 Definition: Let $X$ be a non-empty set. A fuzzy subset $A$ of $X$ is a function $A: X \rightarrow[0,1]$.
1.3 Definition: Let $X$ be a non-empty set. A intuitionistic fuzzy subset $A$ in $X$ is defined as an object of the form $\mathrm{A}=\left\{<\mathrm{x}, \mu_{\mathrm{A}}(\mathrm{x}), v_{\mathrm{A}}(\mathrm{x})>/ \mathrm{x}\right.$ in X$\}$, where $\mu_{\mathrm{A}} \mathrm{X} \rightarrow[0,1]$ and $v_{\mathrm{A}} \mathrm{X} \rightarrow[0,1]$ define the degree of membership and the degree of non-membership of the element $x \in X$ respectively and for every $x \in X$ satisfying $\mu_{A}(x)+v_{A}(x) \leq 1$.
1.4 Definition: Let $(G,+)$ be a group. A fuzzy subset $A$ of $G$ is said to be a fuzzy subgroup of $G$ if $\mu_{A}(x-y) \geq \min \left\{\mu_{A}(x), \mu_{A}(y)\right\}$ for all $x$ and $y$ in $G$.
1.5 Definition: Let ( $G,+$ ) be a group. An intuitionistic fuzzy subset $A$ of $G$ is said to be an intuitionistic fuzzy subgroup of $G$ if it satisfies the following axioms:
(i) $\mu_{\mathrm{A}}(\mathrm{x}-\mathrm{y}) \geq \min \left\{\mu_{\mathrm{A}}(\mathrm{x}), \mu_{\mathrm{A}}(\mathrm{y})\right\}$
(ii) $v_{A}(x-y) \leq \max \left\{v_{\mathrm{A}}(\mathrm{x}), v_{\mathrm{A}}(\mathrm{y})\right\}$ for all x and y in G .

1.6 Definition: Let $G=\left(G_{1} \cup G_{2},+, \bullet\right)$ be a bigroup. Then a fuzzy set $A$ of $G$ is said to be a fuzzy subbigroup of $G$ if there exist two fuzzy subsets $A_{1}$ of $G_{1}$ and $A_{2}$ of $G_{2}$ such that (i) $A=A_{1} \cup A_{2}$ (ii) $A_{1}$ is a fuzzy subgroup of $\left(G_{1},+\right)$ (iii) $A_{2}$ is a fuzzy subgroup of $\left(G_{2}, \bullet\right)$.
1.7 Definition: Let $G=\left(G_{1} \cup G_{2},+, \bullet\right)$ be a bigroup. Then an intuitionistic fuzzy set $A$ of $G$ is said to be an intuitionistic fuzzy subbigroup of $G$ if there exist two intuitionistic fuzzy subsets $A_{1}$ of $G_{1}$ and $A_{2}$ of $G_{2}$ such that (i) $A=A_{1} \cup A_{2}$ (ii) $A_{1}$ is an intuitionistic fuzzy subgroup of $\left(G_{1},+\right)($ iii $) A_{2}$ is an intuitionistic fuzzy subgroup of $\left(G_{2}, \bullet\right)$.
1.8 Definition: Let $A=M \cup N$ and $B=O \cup P$ be any two intuitionistic fuzzy subbigroups of bigroups $G=E \cup F$ and $H=I \cup J$ respectively. The product of $A$ and $B$, denoted by $A \times B$, is defined as $A \times B=(M \times O) \cup(N \times P)$ where $\mu_{\mathrm{M} \times \mathrm{O}}(\mathrm{x}, \mathrm{y})=\min \left\{\mu_{\mathrm{M}}(\mathrm{x}), \mu_{\mathrm{O}}(\mathrm{y})\right\}, v_{\mathrm{M} \times \mathrm{O}}(\mathrm{x}, \mathrm{y})=\max \left\{\mathrm{v}_{\mathrm{M}}(\mathrm{x}), v_{\mathrm{O}}(\mathrm{y})\right\}, \mu_{\mathrm{N} \times \mathrm{P}}(\mathrm{x}, \mathrm{y})=\min \left\{\mu_{\mathrm{N}}(\mathrm{x}), \mu_{\mathrm{P}}(\mathrm{y})\right\}$ and $v_{\mathrm{N} \times \mathrm{P}}(\mathrm{x}, \mathrm{y})=$ $\max \left\{v_{N}(x), v_{P}(y)\right\}$.

## 2. PROPERTIES

2.1 Theorem: If $A=M \cup N$ is an intuitionistic fuzzy subbigroup of a bigroup $G=E \cup F$, then $\mu_{M}(-x)=\mu_{M}(x)$, $\mu_{M}(x) \leq \mu_{M}(e), v_{M}(-x)=v_{M}(x), v_{M}(x) \geq v_{M}(e)$ for all $x$, e in $E, \mu_{N}\left(x^{-1}\right)=\mu_{N}(x), \mu_{N}(x) \leq \mu_{N}\left(e^{\prime}\right), v_{N}\left(x^{-1}\right)=v_{N}(x)$, $v_{\mathrm{N}}(\mathrm{x}) \geq v_{\mathrm{N}}\left(\mathrm{e}^{\prime}\right)$ for all x , $\mathrm{e}^{\prime}$ in F .
2.2 Theorem: If $A=M \cup N$ is an intuitionistic fuzzy subbigroup of a bigroup $G=E \cup F$, then
(i) $\mu_{\mathrm{M}}(\mathrm{x}+\mathrm{y})=\mu_{\mathrm{M}}(\mathrm{y}+\mathrm{x})$ if and only if $\mu_{\mathrm{M}}(\mathrm{x})=\mu_{\mathrm{M}}(-\mathrm{y}+\mathrm{x}+\mathrm{y})$ for all x and y in E
(ii) $\mu_{N}(x y)=\mu_{N}(y x)$ if and only if $\mu_{N}(x)=\mu_{N}\left(y^{-1} x y\right)$ for all $x$ and $y$ in $F$
(iii) $v_{M}(x+y)=v_{M}(y+x)$ if and only if $v_{M}(x)=v_{M}(-y+x+y)$ for all $x$ and $y$ in $E$
(iv) $v_{N}(x y)=v_{N}(y x)$ if and only if $v_{N}(x)=v_{N}\left(\mathrm{y}^{-1} \mathrm{xy}\right)$ for all x and y in F .

Proof: (i) Let $x$ and $y$ belongs to $E$ and $e_{1}$ be an identity element of $E$. Assume that $\mu_{M}(x+y)=\mu_{M}(y+x)$, then $\mu_{\mathrm{M}}(-\mathrm{y}+\mathrm{x}+\mathrm{y})=\mu_{\mathrm{M}}(-\mathrm{y}+\mathrm{y}+\mathrm{x})=\mu_{\mathrm{M}}\left(\mathrm{e}_{1}+\mathrm{x}\right)=\mu_{\mathrm{M}}(\mathrm{x})$. Therefore $\mu_{\mathrm{M}}(\mathrm{x})=\mu_{\mathrm{M}}(-\mathrm{y}+\mathrm{x}+\mathrm{y})$ for all x and y in E. Conversely, assume that $\mu_{M}(x)=\mu_{M}(-y+x+y)$, then $\mu_{M}(x+y)=\mu_{M}(x+y-x+x)=\mu_{M}(y+x)$. Therefore $\mu_{M}(x+y)=\mu_{M}(y+x)$ for all $x$ and $y$ in E. (ii) Let $x$ and $y$ belongs to $F$ and $e_{2}$ be an identity element of $F$. Assume that $\mu_{N}(x y)=\mu_{N}(y x)$, then $\mu_{\mathrm{N}}\left(\mathrm{y}^{-1} \mathrm{xy}\right)=\mu_{\mathrm{N}}\left(\mathrm{y}^{-1} \mathrm{yx}\right)=\mu_{\mathrm{N}}\left(\mathrm{e}_{2} \mathrm{x}\right)=\mu_{\mathrm{N}}(\mathrm{x})$. Therefore $\mu_{\mathrm{N}}(\mathrm{x})=\mu_{\mathrm{N}}\left(\mathrm{y}^{-1} \mathrm{xy}\right)$ for all x and y in F . Conversely, assume that $\mu_{N}(x)=\mu_{N}\left(y^{-1} x y\right)$, then $\mu_{N}(x y)=\mu_{N}\left(x y x x^{-1}\right)=\mu_{N}(y x)$. Therefore $\mu_{N}(x y)=\mu_{N}(y x)$ for all $x$ and $y$ in $F$. (iii) Let $x$ and $y$ belongs to $E$ and $e_{1}$ be an identity element of $E$. Assume that $v_{M}(x+y)=v_{M}(y+x)$, then $v_{M}(-y+x+y)=v_{M}(-y+y+x)=$ $v_{M}\left(e_{1}+x\right)=v_{M}(x)$. Therefore $v_{M}(x)=v_{M}(-y+x+y)$ for all $x$ and $y$ in $E$.

Conversely, assume that $v_{M}(x)=v_{M}(-y+x+y)$, then $v_{M}(x+y)=v_{M}(x+y-x+x)=v_{M}(y+x)$.
Therefore $v_{M}(x+y)=v_{M}(y+x)$ for all $x$ and $y$ in $E$. (iv) Let $x$ and $y$ belongs to $F$ and $e_{2}$ be an identity element of $F$. Assume that $v_{N}(x y)=v_{N}(y x)$, then $v_{N}\left(y^{-1} x y\right)=v_{N}\left(y^{-1} y x\right)=v_{N}\left(e_{2} x\right)=v_{N}(x)$. Therefore $v_{N}(x)=v_{N}\left(y^{-1} x y\right)$ for all $x$ and $y$ in F. Conversely, assume that $v_{N}(x)=v_{N}\left(y^{-1} x y\right)$, then $v_{N}(x y)=v_{N}\left(x y x x^{-1}\right)=v_{N}(y x)$. Therefore $v_{N}(x y)=v_{N}(y x)$ for all $x$ and y in F .
2.3 Theorem: Let $A=M \cup N$ be an intuitionistic fuzzy subbigroup of a bigroup $G=E \cup F$. If
(i) $\mu_{M}(x)<\mu_{M}(y)$, then $\mu_{M}(x+y)=\mu_{M}(x)=\mu_{M}(y+x)$ for all $x$ and $y$ in $E$
(ii) $\mu_{\mathrm{N}}(\mathrm{x})<\mu_{\mathrm{N}}(\mathrm{y})$, then $\mu_{\mathrm{N}}(\mathrm{xy})=\mu_{\mathrm{N}}(\mathrm{x})=\mu_{\mathrm{N}}(\mathrm{yx})$ for all x and y in F
(iii) $v_{M}(x)<v_{M}(y)$, then $v_{M}(x+y)=v_{M}(y)=v_{M}(y+x)$ for all $x$ and $y$ in $E$
(iv) $v_{N}(x)<v_{N}(y)$, then $v_{N}(x y)=v_{N}(y)=v_{N}(y x)$ for all $x$ and $y$ in $F$.

Proof: (i) Let $x$ and $y$ belongs to E. Assume that $\mu_{M}(x)<\mu_{M}(y)$, then $\mu_{M}(x+y) \geq \min \left\{\mu_{M}(x), \mu_{M}(y)\right\}=\mu_{M}(x)$; and $\mu_{\mathrm{M}}(\mathrm{x})=\mu_{\mathrm{M}}(\mathrm{x}+\mathrm{y}-\mathrm{y}) \geq \min \left\{\mu_{\mathrm{M}}(\mathrm{x}+\mathrm{y}), \mu_{\mathrm{M}}(\mathrm{y})\right\}=\mu_{\mathrm{M}}(\mathrm{x}+\mathrm{y})$. Therefore $\mu_{\mathrm{M}}(\mathrm{x}+\mathrm{y})=\mu_{\mathrm{M}}(\mathrm{x})$ for all x and y in E. And $\mu_{M}(y+x) \geq \min \left\{\mu_{M}(y), \mu_{M}(x)\right\}=\mu_{M}(x)$; and $\mu_{M}(x)=\mu_{M}(-y+y+x) \geq \min \left\{\mu_{M}(y), \mu_{M}(y+x)\right\}=\mu_{M}(y+x)$. Therefore $\mu_{\mathrm{M}}(\mathrm{y}+\mathrm{x})=\mu_{\mathrm{M}}(\mathrm{x})$ for all x and y in E. Hence $\mu_{\mathrm{M}}(\mathrm{x}+\mathrm{y})=\mu_{\mathrm{M}}(\mathrm{x})=\mu_{\mathrm{M}}(\mathrm{y}+\mathrm{x})$ for all x and y in E. (ii) Let x and y belongs to F. Assume that $\mu_{N}(x)<\mu_{N}(y)$, then $\mu_{N}(x y) \geq \min \left\{\mu_{N}(x), \mu_{N}(y)\right\}=\mu_{N}(x)$; and $\mu_{N}(x)=\mu_{N}\left(x y y^{-1}\right) \geq \min \left\{\mu_{N}(x y)\right.$, $\left.\mu_{N}(y)\right\}=\mu_{N}(x y)$. Therefore $\mu_{N}(x y)=\mu_{N}(x)$ for all $x$ and $y$ in $F$. And $\mu_{N}(y x) \geq \min \left\{\mu_{N}(y), \mu_{N}(x)\right\}=\mu_{N}(x)$; and $\mu_{\mathrm{N}}(\mathrm{x})=\mu_{\mathrm{N}}\left(\mathrm{y}^{-1} \mathrm{yx}\right) \geq \min \left\{\mu_{\mathrm{N}}(\mathrm{y}), \mu_{\mathrm{N}}(\mathrm{yx})\right\}=\mu_{\mathrm{N}}(\mathrm{yx})$. Therefore $\mu_{\mathrm{N}}(\mathrm{yx})=\mu_{\mathrm{N}}(\mathrm{x})$ for all x and y in F. Hence $\mu_{\mathrm{N}}(\mathrm{xy})=\mu_{\mathrm{N}}(\mathrm{x})$ $=\mu_{\mathrm{N}}(\mathrm{yx})$ for all x and y in F. (iii) Let x and y belongs to E. Assume that $v_{M}(\mathrm{x})<v_{\mathrm{M}}(\mathrm{y})$, then $v_{\mathrm{M}}(\mathrm{x}+\mathrm{y}) \leq \max \left\{v_{\mathrm{M}}(\mathrm{x})\right.$, $\left.v_{M}(\mathrm{y})\right\}=v_{\mathrm{M}}(\mathrm{y})$; and $v_{\mathrm{M}}(\mathrm{y})=v_{\mathrm{M}}(-\mathrm{x}+\mathrm{x}+\mathrm{y}) \leq \max \left\{\mathrm{v}_{\mathrm{M}}(\mathrm{x}+\mathrm{y}), v_{\mathrm{M}}(\mathrm{x})\right\}=v_{\mathrm{M}}(\mathrm{x}+\mathrm{y})$. Therefore $v_{\mathrm{M}}(\mathrm{x}+\mathrm{y})=v_{\mathrm{M}}(\mathrm{y})$ for all x and $y$ in E. And $v_{M}(y+x) \leq \max \left\{v_{M}(y), v_{M}(x)\right\}=v_{M}(y)$; and $v_{M}(y)=v_{M}(y+x-x) \leq \max \left\{v_{M}(x), v_{M}(y+x)\right\}=v_{M}(y+x)$. Therefore $v_{M}(y+x)=v_{M}(y)$ for all $x$ and $y$ in E. Hence $v_{M}(x+y)=v_{M}(y)=v_{M}(y+x)$ for all $x$ and $y$ in $E$. (iv) Let $x$ and $y$ belongs to $F$. Assume that $v_{N}(x)<v_{N}(y)$, then $v_{N}(x y) \leq \max \left\{v_{N}(x), v_{N}(y)\right\}=v_{N}(y)$; and $v_{N}(y)=v_{N}\left(x^{-1} x y\right) \leq$
$\max \left\{v_{N}(x y), v_{N}(x)\right\}=v_{N}(x y)$. Therefore $v_{N}(x y)=v_{N}(y)$ for all $x$ and $y$ in $F$. And $v_{N}(y x) \leq \max \left\{v_{N}(y), v_{N}(x)\right\}=v_{N}(y)$; and $v_{N}(y)=v_{N}\left(y x x^{-1}\right) \leq \max \left\{v_{N}(x), v_{N}(y x)\right\}=v_{N}(y x)$. Therefore $v_{N}(y x)=v_{N}(y)$ for all $x$ and $y$ in F. Hence $v_{N}(x y)=$ $v_{N}(y)=v_{N}(y x)$ for all $x$ and $y$ in $F$.
2.4 Theorem: Let $A=M \cup N$ be an intuitionistic fuzzy subbigroup of a bigroup $G=E \cup F$. If
(i) $\mu_{\mathrm{M}}(\mathrm{x})>\mu_{\mathrm{M}}(\mathrm{y})$, then $\mu_{\mathrm{M}}(\mathrm{x}+\mathrm{y})=\mu_{\mathrm{M}}(\mathrm{y})=\mu_{\mathrm{M}}(\mathrm{y}+\mathrm{x})$ for all x and y in E
(ii) $\mu_{\mathrm{N}}(\mathrm{x})>\mu_{\mathrm{N}}(\mathrm{y})$, then $\mu_{\mathrm{N}}(\mathrm{xy})=\mu_{\mathrm{N}}(\mathrm{y})=\mu_{\mathrm{N}}(\mathrm{yx})$ for all x and y in F
(iii) $v_{M}(x)>v_{M}(y)$, then $v_{M}(x+y)=v_{M}(x)=v_{M}(y+x)$ for all $x$ and $y$ in $E$
(iv) $v_{N}(x)>v_{N}(y)$, then $v_{N}(x y)=v_{N}(x)=v_{N}(y x)$ for all $x$ and $y$ in $F$.

Proof: It is trivial.
2.5 Theorem: Let $A=M \cup N$ be an intuitionistic fuzzy subbigroup of a bigroup $G=E \cup F$. If (i) there is a sequence $\left\{x_{n}\right\}$ in $E$ such that $\lim _{n \rightarrow \alpha} \min \left\{\mu_{M}\left(\mathrm{x}_{\mathrm{n}}\right), \mu_{\mathrm{M}}\left(\mathrm{x}_{\mathrm{n}}\right)\right\}=1$, then $\mu_{\mathrm{M}}\left(\mathrm{e}_{1}\right)=1$, where $\mathrm{e}_{1}$ is the identity element in E , (ii) there is a sequence $\left\{\mathrm{x}_{\mathrm{n}}\right\}$ in F such that $\lim _{n \rightarrow \alpha} \min \left\{\mu_{\mathrm{N}}\left(\mathrm{x}_{\mathrm{n}}\right), \mu_{\mathrm{N}}\left(\mathrm{x}_{\mathrm{n}}\right)\right\}=1$, then $\mu_{\mathrm{N}}\left(\mathrm{e}_{2}\right)=1$, where $\mathrm{e}_{2}$ is the identity in F , (iii) there is a sequence $\left\{x_{n}\right\}$ in $E$ such that $\lim _{n \rightarrow \alpha} \max \left\{v_{M}\left(x_{n}\right), v_{M}\left(x_{n}\right)\right\}=0$, then $v_{M}\left(e_{1}\right)=0$, where $e_{1}$ is the identity element in $E$, (iv) there is a sequence $\left\{\mathrm{x}_{\mathrm{n}}\right\}$ in F such that $\lim _{n \rightarrow \alpha} \max \left\{v_{N}\left(\mathrm{x}_{\mathrm{n}}\right), v_{N}\left(\mathrm{x}_{\mathrm{n}}\right)\right\}=0$, then $v_{N}\left(\mathrm{e}_{2}\right)=0$, where $\mathrm{e}_{2}$ is the identity in F .

Proof: (i) Let $e_{1}$ be the identity element in $E$ and $x_{n}$ in $E$. Then $\mu_{M}\left(e_{1}\right)=\mu_{M}\left(x_{n}-x_{n}\right) \geq \min \left\{\mu_{M}\left(x_{n}\right), \mu_{M}\left(x_{n}\right)\right\}=\mu_{M}\left(x_{n}\right)$. Therefore for each n, we have $\mu_{M}\left(e_{1}\right) \geq \mu_{M}\left(x_{n}\right)$. But $\mu_{M}\left(e_{1}\right) \geq \lim _{n \rightarrow \alpha} \min \left\{\mu_{M}\left(x_{n}\right), \mu_{M}\left(x_{n}\right)\right\}=1$. Therefore $\mu_{M}\left(e_{1}\right)=1$ (ii) Let $\mathrm{e}_{2}$ be the identity element in F and $\mathrm{x}_{\mathrm{n}}$ in F . Then $\mu_{N}\left(\mathrm{e}_{2}\right)=\mu_{\mathrm{N}}\left(\mathrm{x}_{\mathrm{n}} \mathrm{X}_{\mathrm{n}}{ }^{-1}\right) \geq \min \left\{\mu_{\mathrm{N}}\left(\mathrm{x}_{\mathrm{n}}\right), \mu_{\mathrm{N}}\left(\mathrm{x}_{\mathrm{n}}\right)\right\}=\mu_{\mathrm{N}}\left(\mathrm{x}_{\mathrm{n}}\right)$. Therefore for each n, we have $\mu_{N}\left(e_{2}\right) \geq \mu_{N}\left(x_{n}\right)$. But $\mu_{N}\left(e_{2}\right) \geq \lim _{n \rightarrow \alpha} \min \left\{\mu_{N}\left(x_{n}\right), \mu_{N}\left(x_{n}\right)\right\}=1$. Therefore $\mu_{N}\left(e_{2}\right)=1$.
(iii) Let $e_{1}$ be the identity element in $E$ and $x_{n}$ in E. Then $v_{M}\left(e_{1}\right)=v_{M}\left(x_{n}-x_{n}\right) \leq \max \left\{v_{M}\left(x_{n}\right), v_{M}\left(x_{n}\right)\right\}=v_{M}\left(x_{n}\right)$. Therefore for each $n$, we have $v_{M}\left(e_{1}\right) \leq v_{M}\left(X_{n}\right)$. But $v_{M}\left(e_{1}\right) \leq \lim _{n \rightarrow \alpha} \max \left\{v_{M}\left(X_{n}\right), v_{M}\left(x_{n}\right)\right\}=0$. Therefore $v_{M}\left(e_{1}\right)=0$. (iv) Let $e_{2}$ be the identity element in $F$ and $x_{n}$ in $F$. Then $v_{N}\left(e_{2}\right)=v_{N}\left(x_{n} x_{n}{ }^{-1}\right) \leq \max \left\{v_{N}\left(x_{n}\right), v_{N}\left(x_{n}\right)\right\}=v_{N}\left(x_{n}\right)$. Therefore for each n, we have $v_{N}\left(e_{2}\right) \leq v_{N}\left(x_{n}\right)$. But $v_{N}\left(e_{2}\right) \leq \lim _{n \rightarrow \alpha} \max \left\{v_{N}\left(x_{n}\right), v_{N}\left(x_{n}\right)\right\}=0$. Therefore $v_{N}\left(e_{2}\right)=0$.
2.6 Theorem: If $A=M \cup N$ and $B=O \cup P$ are intuitionistic fuzzy subbigroups of the bigroups $G=E \cup F$ and $H=I \cup J$, respectively, then $A \times B=(M \times O) \cup(N \times P)$ is an intuitionistic fuzzy subbigroup of $G \times H=(E \times I) \cup(F \times J)$.

Proof: Let $x_{1}$ and $x_{2}$ be in E, $y_{1}$ and $y_{2}$ be in I. Then $\left(x_{1}, y_{1}\right)$ and $\left(x_{2}, y_{2}\right)$ are in E×I. Now $\mu_{M \times 0}\left[\left(x_{1}, y_{1}\right)-\left(x_{2}, y_{2}\right)\right]=$ $\mu_{\mathrm{M} \times \mathrm{O}}\left(\left(\mathrm{x}_{1}-\mathrm{x}_{2}\right),\left(\mathrm{y}_{1}-\mathrm{y}_{2}\right)\right)=\min \left\{\mu_{\mathrm{M}}\left(\mathrm{x}_{1}-\mathrm{x}_{2}\right), \mu_{\mathrm{O}}\left(\mathrm{y}_{1}-\mathrm{y}_{2}\right)\right\} \geq \min \left\{\min \left\{\mu_{\mathrm{M}}\left(\mathrm{x}_{1}\right), \mu_{\mathrm{M}}\left(\mathrm{x}_{2}\right)\right\}, \min \left\{\mu_{\mathrm{O}}\left(\mathrm{y}_{1}\right), \mu_{\mathrm{O}}\left(\mathrm{y}_{2}\right)\right\}\right\}=$ $\min \left\{\min \left\{\mu_{\mathrm{M}}\left(\mathrm{x}_{1}\right), \mu_{\mathrm{O}}\left(\mathrm{y}_{1}\right)\right\}, \min \left\{\mu_{\mathrm{M}}\left(\mathrm{x}_{2}\right), \mu_{\mathrm{O}}\left(\mathrm{y}_{2}\right)\right\}\right\}=\min \left\{\mu_{\mathrm{M} \times \mathrm{O}}\left(\mathrm{x}_{1}, \mathrm{y}_{1}\right), \mu_{\mathrm{M} \times \mathrm{O}}\left(\mathrm{x}_{2}, \mathrm{y}_{2}\right)\right\}$. Therefore $\mu_{\mathrm{M} \times \mathrm{O}}\left[\left(\mathrm{x}_{1}, \mathrm{y}_{1}\right)-\left(\mathrm{x}_{2}, \mathrm{y}_{2}\right)\right] \geq$ $\min \left\{\mu_{\mathrm{M} \times \mathrm{O}}\left(\mathrm{x}_{1}, \mathrm{y}_{1}\right), \mu_{\mathrm{M} \times \mathrm{O}}\left(\mathrm{x}_{2}, \mathrm{y}_{2}\right)\right\}$. And $v_{\mathrm{M} \times \mathrm{O}}\left[\left(\mathrm{x}_{1}, \mathrm{y}_{1}\right)-\left(\mathrm{x}_{2}, \mathrm{y}_{2}\right)\right]=v_{\mathrm{M} \times \mathrm{O}}\left(\left(\mathrm{x}_{1}-\mathrm{x}_{2}\right),\left(\mathrm{y}_{1}-\mathrm{y}_{2}\right)\right)=\max \left\{\mathrm{v}_{\mathrm{M}}\left(\mathrm{x}_{1}-\mathrm{x}_{2}\right), v_{\mathrm{O}}\left(\mathrm{y}_{1}-\mathrm{y}_{2}\right)\right\} \leq$ $\max \left\{\max \left\{\mathrm{v}_{\mathrm{M}}\left(\mathrm{x}_{1}\right), \mathrm{v}_{\mathrm{M}}\left(\mathrm{x}_{2}\right)\right\}, \max \left\{\mathrm{v}_{\mathrm{O}}\left(\mathrm{y}_{1}\right), \mathrm{v}_{\mathrm{O}}\left(\mathrm{y}_{2}\right)\right\}\right\}=\max \left\{\max \left\{\mathrm{v}_{\mathrm{M}}\left(\mathrm{x}_{1}\right), \mathrm{v}_{\mathrm{O}}\left(\mathrm{y}_{1}\right)\right\}, \max \left\{\mathrm{v}_{\mathrm{M}}\left(\mathrm{x}_{2}\right), \mathrm{v}_{\mathrm{O}}\left(\mathrm{y}_{2}\right)\right\}\right\}=\max \left\{\mathrm{v}_{\mathrm{M} \times \mathrm{O}}\right.$ $\left.\left(\mathrm{x}_{1}, \mathrm{y}_{1}\right), \mathrm{v}_{\mathrm{M} \times \mathrm{O}}\left(\mathrm{x}_{2}, \mathrm{y}_{2}\right)\right\}$. Therefore $\mathrm{v}_{\mathrm{M} \times \mathrm{O}}\left[\left(\mathrm{x}_{1}, \mathrm{y}_{1}\right)-\left(\mathrm{x}_{2}, \mathrm{y}_{2}\right)\right] \leq \max \left\{\mathrm{v}_{\mathrm{M} \times \mathrm{O}}\left(\mathrm{x}_{1}, \mathrm{y}_{1}\right), \mathrm{v}_{\mathrm{M} \times \mathrm{O}}\left(\mathrm{x}_{2}, \mathrm{y}_{2}\right)\right\}$. Hence $\mathrm{M} \times \mathrm{O}$ is an intuitionistic fuzzy subgroup of $E \times I$. Let $x_{1}$ and $x_{2}$ be in $F, y_{1}$ and $y_{2}$ be in $J$. Then ( $x_{1}, y_{1}$ ) and ( $x_{2}, y_{2}$ ) are in $F \times J$. Also $\mu_{\mathrm{N} \times \mathrm{P}}\left[\left(\mathrm{x}_{1}, \mathrm{y}_{1}\right)\left(\mathrm{x}_{2}, \mathrm{y}_{2}\right)^{-1}\right]=\mu_{\mathrm{N} \times \mathrm{P}}\left(\mathrm{x}_{1} \mathrm{x}_{2}{ }^{-1}, \mathrm{y}_{1} \mathrm{y}_{2}{ }^{-1}\right)=\min \left\{\mu_{\mathrm{N}}\left(\mathrm{x}_{1} \mathrm{x}_{2}{ }^{-1}\right), \mu_{\mathrm{P}}\left(\mathrm{y}_{1} \mathrm{y}_{2}{ }^{-1}\right)\right\} \geq \min \left\{\min \left\{\mu_{\mathrm{N}}\left(\mathrm{x}_{1}\right), \mu_{\mathrm{N}}\left(\mathrm{x}_{2}\right)\right\}, \min \left\{\mu_{\mathrm{P}}\left(\mathrm{y}_{1}\right)\right.\right.$, $\left.\left.\mu_{\mathrm{P}}\left(\mathrm{y}_{2}\right)\right\}\right\}=\min \left\{\min \left\{\mu_{\mathrm{N}}\left(\mathrm{x}_{1}\right), \mu_{\mathrm{P}}\left(\mathrm{y}_{1}\right)\right\}, \min \left\{\mu_{\mathrm{N}}\left(\mathrm{x}_{2}\right), \mu_{\mathrm{P}}\left(\mathrm{y}_{2}\right)\right\}\right\}=\min \left\{\mu_{\mathrm{N} \times \mathrm{P}}\left(\mathrm{x}_{1}, \mathrm{y}_{1}\right), \mu_{\mathrm{N} \times \mathrm{P}}\left(\mathrm{x}_{2}, \mathrm{y}_{2}\right)\right\}$. Therefore $\mu_{\mathrm{N} \times \mathrm{P}}\left[\left(\mathrm{x}_{1}, \mathrm{y}_{1}\right)\right.$ $\left.\left(\mathrm{x}_{2}, \mathrm{y}_{2}\right)^{-1}\right] \geq \min \left\{\mu_{\mathrm{N} \times \mathrm{P}}\left(\mathrm{x}_{1}, \mathrm{y}_{1}\right), \mu_{\mathrm{N} \times \mathrm{P}}\left(\mathrm{x}_{2}, \mathrm{y}_{2}\right)\right\}$. And $v_{\mathrm{N} \times \mathrm{P}}\left[\left(\mathrm{x}_{1}, \mathrm{y}_{1}\right)\left(\mathrm{x}_{2}, \mathrm{y}_{2}\right)^{-1}\right]=v_{\mathrm{N} \times \mathrm{P}}\left(\mathrm{x}_{1} \mathrm{x}_{2}{ }^{-1}, \mathrm{y}_{1} \mathrm{y}_{2}{ }^{-1}\right)=\max \left\{v_{\mathrm{N}}\left(\mathrm{x}_{1} \mathrm{x}_{2}{ }^{-1}\right)\right.$, $\left.v_{P}\left(\mathrm{y}_{1} \mathrm{y}_{2}{ }^{-1}\right)\right\} \leq \max \left\{\max \left\{v_{\mathrm{N}}\left(\mathrm{x}_{1}\right), v_{\mathrm{N}}\left(\mathrm{x}_{2}\right)\right\}, \max \left\{\mathrm{v}_{\mathrm{P}}\left(\mathrm{y}_{1}\right), v_{\mathrm{P}}\left(\mathrm{y}_{2}\right)\right\}\right\}=\max \left\{\max \left\{\mathrm{v}_{\mathrm{N}}\left(\mathrm{x}_{1}\right), v_{\mathrm{P}}\left(\mathrm{y}_{1}\right)\right\}, \max \left\{v_{\mathrm{N}}\left(\mathrm{x}_{2}\right), v_{\mathrm{P}}\left(\mathrm{y}_{2}\right)\right\}\right\}=\max$ $\left\{v_{N \times P}\left(x_{1}, y_{1}\right), v_{N \times P}\left(x_{2}, y_{2}\right)\right\}$. Therefore $v_{N \times P}\left[\left(x_{1}, y_{1}\right)\left(x_{2}, y_{2}\right)^{-1}\right] \leq \max \left\{v_{N \times P}\left(x_{1}, y_{1}\right), v_{N \times P}\left(x_{2}, y_{2}\right)\right\}$. Therefore $N \times P$ is an intuitionistic fuzzy subgroup of $\mathrm{F} \times \mathrm{J}$. Hence $\mathrm{A} \times \mathrm{B}$ is an intuitionistic fuzzy subbigroup of $\mathrm{G} \times \mathrm{H}$.
2.7 Theorem: Let an intuitionistic fuzzy subbigroup $A=M \cup N$ of a bigroup $G=E \cup F$ be conjugate to an intuitionistic fuzzy subbigroup $K=Q \cup R$ of $G=E \cup F$ and an intuitionistic fuzzy subbigroup $B=O \cup P$ of a bigroup $H=I \cup J$ be conjugate to an intuitionistic fuzzy subbigroup $\mathrm{L}=\mathrm{S} \cup \mathrm{T}$ of $\mathrm{H}=\mathrm{I} \cup \mathrm{J}$. Then an intuitionistic fuzzy subbigroup $\mathrm{A} \times \mathrm{B}=(\mathrm{M} \times \mathrm{O}) \cup(\mathrm{N} \times \mathrm{P})$ of a bigroup $\mathrm{G} \times \mathrm{H}=(\mathrm{E} \times \mathrm{I}) \cup(\mathrm{F} \times \mathrm{J})$ is conjugate to an intuitionistic fuzzy subbigroup $K \times L=(Q \times S) \cup(R \times T)$ of $G \times H=(E \times I) \cup(F \times J)$.

Proof: Let $\mathrm{x},-\mathrm{x}$ and f be in E and $\mathrm{y},-\mathrm{y}$ and g be in I . Then ( $\mathrm{x}, \mathrm{y}),(-\mathrm{x},-\mathrm{y})$ and (f,g) are in ExI. Now $\mu_{\mathrm{M} \times \mathrm{O}}(\mathrm{f}, \mathrm{g})=\min \left\{\mu_{\mathrm{M}}(\mathrm{f}), \mu_{\mathrm{O}}(\mathrm{g})\right\}=\min \left\{\mu_{\mathrm{Q}}(\mathrm{x}+\mathrm{f}-\mathrm{x}), \mu_{\mathrm{S}}(\mathrm{y}+\mathrm{g}-\mathrm{y})\right\}=\mu_{\mathrm{Q} \times \mathrm{S}}(\mathrm{x}+\mathrm{f}-\mathrm{x}, \mathrm{y}+\mathrm{g}-\mathrm{y})=\mu_{\mathrm{Q} \times \mathrm{S}}[(\mathrm{x}, \mathrm{y})+(\mathrm{f}, \mathrm{g})+(-\mathrm{x},-\mathrm{y})]$ $=\mu_{\mathrm{Q} \times \mathrm{S}}[(\mathrm{x}, \mathrm{y})+(\mathrm{f}, \mathrm{g})-(\mathrm{x}, \mathrm{y})]$. Therefore $\mu_{\mathrm{M} \times \mathrm{O}}(\mathrm{f}, \mathrm{g})=\mu_{\mathrm{Q} \times \mathrm{S}}[(\mathrm{x}, \mathrm{y})+(\mathrm{f}, \mathrm{g})-(\mathrm{x}, \mathrm{y})]$. And $v_{\mathrm{M} \times \mathrm{O}}(\mathrm{f}, \mathrm{g})=\max \left\{\mathrm{v}_{\mathrm{M}}(\mathrm{f}), v_{\mathrm{o}}(\mathrm{g})\right\}=$ $\max \left\{v_{\mathrm{Q}}(\mathrm{x}+\mathrm{f}-\mathrm{x}), v_{\mathrm{S}}(\mathrm{y}+\mathrm{g}-\mathrm{y})\right\}=v_{\mathrm{Q} \times \mathrm{S}}(\mathrm{x}+\mathrm{f}-\mathrm{x}, \mathrm{y}+\mathrm{g}-\mathrm{y})=\mathrm{v}_{\mathrm{Q} \times \mathrm{S}}[(\mathrm{x}, \mathrm{y})+(\mathrm{f}, \mathrm{g})+(-\mathrm{x},-\mathrm{y})]=\mathrm{v}_{\mathrm{Q} \times 5}[(\mathrm{x}, \mathrm{y})+(\mathrm{f}, \mathrm{g})-(\mathrm{x}, \mathrm{y})]$. Therefore $v_{\mathrm{M} \times \mathrm{O}}(\mathrm{f}, \mathrm{g})=\mathrm{v}_{\mathrm{Q} \times} \leq[(\mathrm{x}, \mathrm{y})+(\mathrm{f}, \mathrm{g})-(\mathrm{x}, \mathrm{y})]$. Hence an intuitionistic fuzzy subgroup $\mathrm{M} \times \mathrm{O}$ of a group $\mathrm{E} \times \mathrm{I}$ is conjugate to an intuitionistic fuzzy subgroup $\mathrm{Q} \times$ S of $\mathrm{E} \times \mathrm{I}$. Let $\mathrm{x}, \mathrm{x}^{-1}$ and f be in F and $\mathrm{y}, \mathrm{y}^{-1}$ and g be in J . Then ( $\mathrm{x}, \mathrm{y}$ ), $\left(\mathrm{x}^{-1}, \mathrm{y}^{-1}\right)$ and $(\mathrm{f}, \mathrm{g})$ are in $\mathrm{F} \times \mathrm{J}$. Now $\mu_{\mathrm{N} \times \mathrm{P}}(\mathrm{f}, \mathrm{g})=\min \left\{\mu_{\mathrm{N}}(\mathrm{f}), \mu_{\mathrm{P}}(\mathrm{g})\right\}=\min \left\{\mu_{\mathrm{R}}\left(\mathrm{xfx}^{-1}\right), \mu_{\mathrm{T}}\left(\mathrm{ygy}^{-1}\right)\right\}=\mu_{\mathrm{R} \times \mathrm{T}}\left(\mathrm{xfx}^{-1}, \mathrm{ygy}^{-1}\right)=$ $\mu_{\mathrm{R} \times \mathrm{T}}\left[(\mathrm{x}, \mathrm{y})(\mathrm{f}, \mathrm{g}) \quad\left(\mathrm{x}^{-1}, \mathrm{y}^{-1}\right)\right]=\mu_{\mathrm{R} \times \mathrm{T}}\left[(\mathrm{x}, \mathrm{y})(\mathrm{f}, \mathrm{g})(\mathrm{x}, \mathrm{y})^{-1}\right]$. Therefore $\mu_{\mathrm{N} \times \mathrm{P}}(\mathrm{f}, \mathrm{g})=\mu_{\mathrm{R} \times \mathrm{T}}\left[(\mathrm{x}, \mathrm{y})(\mathrm{f}, \mathrm{g})(\mathrm{x}, \mathrm{y})^{-1}\right]$. And $v_{\mathrm{N} \times \mathrm{P}}(\mathrm{f}, \mathrm{g})=$ $\max \left\{v_{\mathrm{N}}(\mathrm{f}), v_{\mathrm{P}}(\mathrm{g})\right\}=\max \left\{v_{\mathrm{R}}\left(\mathrm{xfx}{ }^{-1}\right), v_{\mathrm{T}}\left(\mathrm{ygy}^{-1}\right)\right\}=v_{\mathrm{R} \times \mathrm{T}}\left(\mathrm{xfx}{ }^{-1}, \operatorname{ygy}^{-1}\right)=v_{\mathrm{R} \times \mathrm{T}}\left[(\mathrm{x}, \mathrm{y})(\mathrm{f}, \mathrm{g})\left(\mathrm{x}^{-1}, \mathrm{y}^{-1}\right)\right]=v_{\mathrm{R} \times \mathrm{T}}[(\mathrm{x}, \mathrm{y})(\mathrm{f}, \mathrm{g})(\mathrm{x}$, $\left.y)^{-1}\right]$. Therefore $v_{\mathrm{N} \times \mathrm{P}}(\mathrm{f}, \mathrm{g})=v_{\mathrm{R} \times \mathrm{T}}\left[(\mathrm{x}, \mathrm{y})(\mathrm{f}, \mathrm{g})(\mathrm{x}, \mathrm{y})^{-1}\right]$. Therefore an intuitionistic fuzzy subgroup $\mathrm{N} \times \mathrm{P}$ of a group $\mathrm{F} \times \mathrm{J}$ is conjugate to an intuitionistic fuzzy subgroup $\mathrm{R} \times \mathrm{T}$ of $\mathrm{F} \times \mathrm{J}$. Hence an intuitionistic fuzzy subbigroup $\mathrm{A} \times \mathrm{B}=(\mathrm{M} \times \mathrm{O}) \cup(\mathrm{N} \times \mathrm{P})$ of a bigroup $\mathrm{G} \times \mathrm{H}=(\mathrm{E} \times \mathrm{I}) \cup(\mathrm{F} \times \mathrm{J})$ is conjugate to an intuitionistic fuzzy subbigroup $K \times L=(Q \times S) \cup(R \times T)$ of $G \times H=(E \times I) \cup(F \times J)$.
2.8 Theorem: Let $A=M \cup N$ and $B=O \cup P$ be intuitionistic fuzzy subsets of the bigroups $G=E \cup F$ and $H=I \cup J$, respectively and $A \times B=(M \times O) \cup(N \times P)$ be an intuitionistic fuzzy subbigroup of $G \times H=(E \times I) \cup(F \times J)$. Then the followings are true:
(i) if $\mu_{M}(x) \leq \mu_{0}\left(e_{2}\right), v_{M}(x) \geq v_{O}\left(e_{2}\right)$, then $M$ is an intuitionistic fuzzy subgroup of $E$
(ii) if $\mu_{N}(x) \leq \mu_{P}\left(e_{2}^{\prime}\right), \mu_{N}(x) \geq \mu_{P}\left(e_{2}\right)$, then $N$ is an intuitionistic fuzzy subgroup of $F$
(iii) A is an intuitionistic fuzzy subbigroup of $G$
(iv) if $\mu_{O}(x) \leq \mu_{M}\left(e_{1}\right), v_{O}(x) \geq v_{M}\left(e_{1}\right)$, then $O$ is an intuitionistic fuzzy subgroup of $I$
(v) if $\mu_{P}(x) \leq \mu_{N}\left(e_{1}^{1}\right), \mu_{P}(x) \geq \mu_{N}\left(e_{1}{ }^{\prime}\right)$, then $P$ is an intuitionistic fuzzy subgroup of $J$
(vi) $B$ is an intuitionistic fuzzy subbigroup of $H$
(vii) either A is an intuitionistic fuzzy subbigroup of G or B is an intuitionistic fuzzy subbigroup of H .

Proof: Let $A \times B=(M \times O) \cup(N \times P)$ be an intuitionistic fuzzy subbigroup of $G \times H=(E \times I) \cup(F \times J)$. (i) Let $x$ and $y$ be in $E$ and $e_{2}$ be in I. Then ( $x, e_{2}$ ) and ( $y, e_{2}$ ) are in E×I. Using the property $\mu_{M}(x) \leq \mu_{0}\left(e_{2}\right), v_{M}(x) \geq v_{0}\left(e_{2}\right)$, we get $\mu_{M}(x-y)$ $=\min \left\{\mu_{M}(x-y), \mu_{0}\left(e_{2}+e_{2}\right)\right\}=\mu_{M \times O}\left((x-y),\left(e_{2}+e_{2}\right)\right)=\mu_{M \times O}\left[\left(x, e_{2}\right)+\left(-y, e_{2}\right)\right] \geq \min \left\{\mu_{M \times O}\left(x, e_{2}\right), \mu_{M \times O}\left(-y, e_{2}\right)\right\}=\min \{\min$ $\left.\left\{\mu_{M}(x), \mu_{O}\left(e_{2}\right)\right\}, \min \left\{\mu_{M}(y), \mu_{O}\left(e_{2}\right)\right\}\right\}=\min \left\{\mu_{M}(x), \mu_{M}(y)\right\}$. Therefore $\mu_{M}(x-y) \geq \min \left\{\mu_{M}(x), \mu_{M}(y)\right\}$ for all $x$ and $y$ in E. And $v_{M}(x-y)=\max \left\{v_{M}(x-y), v_{O}\left(e_{2}+e_{2}\right)\right\}=v_{M \times O}\left((x-y),\left(e_{2}+e_{2}\right)\right)=v_{M \times O}\left[\left(x, e_{2}\right)+\left(-y, e_{2}\right)\right] \leq \max \left\{v_{M \times O}\left(x, e_{2}\right)\right.$, $\left.v_{M \times O}\left(-y, e_{2}\right)\right\}=\max \left\{\max \left\{v_{M}(x), v_{0}\left(e_{2}\right)\right\}, \max \left\{v_{M}(y), v_{O}\left(e_{2}\right)\right\}\right\}=\max \left\{v_{M}(x), v_{M}(y)\right\}$. Therefore $v_{M}(x-y) \leq$ $\max \left\{v_{\mathrm{M}}(\mathrm{x}), v_{\mathrm{M}}(\mathrm{y})\right\}$ for all x and y in E . Hence M is an intuitionistic fuzzy subgroup of E . (ii) Let x and y be in F and $\mathrm{e}_{2}{ }^{1}$ be in $J$. Then ( $x, e_{2}^{\prime}$ ) and ( $y, e_{2}^{\prime}$ ) are in $F \times J$. Using the property $\mu_{N}(x) \leq \mu_{P}\left(e_{2}^{\prime}\right), v_{N}(x) \geq v_{P}\left(e_{2}^{\prime}\right)$, we get $\mu_{N}\left(x^{-1}\right)=$ $\min \left\{\mu_{\mathrm{N}}\left(\mathrm{xy}^{-1}\right), \mu_{\mathrm{P}}\left(\mathrm{e}_{2}^{\prime} \mathrm{e}_{2}^{\prime}\right)\right\}=\mu_{\mathrm{N} \times \mathrm{P}}\left(\left(\mathrm{xy}^{-1}\right),\left(\mathrm{e}_{2}^{\prime} \mathrm{e}_{2}^{\prime}\right)\right)=\mu_{\mathrm{N} \times \mathrm{P}}\left[\left(\mathrm{x}, \mathrm{e}_{2}^{\prime}\right)\left(\mathrm{y}^{-1}, \mathrm{e}_{2}^{\prime}\right)\right] \geq \min \left\{\mu_{\mathrm{N} \times \mathrm{P}}\left(\mathrm{x}, \mathrm{e}_{2}^{\prime}\right), \mu_{\mathrm{N} \times \mathrm{P}}\left(\mathrm{y}^{-1}, \mathrm{e}_{2}^{\prime}\right)\right\}=\min$ $\left\{\min \left\{\mu_{N}(x), \mu_{P}\left(e_{2}^{\prime}\right)\right\}, \min \left\{\mu_{N}(y), \mu_{P}\left(e_{2}^{\prime}\right)\right\}\right\}=\min \left\{\mu_{N}(x), \mu_{N}(y)\right\}$. Therefore $\mu_{N}\left(x^{-1}\right) \geq \min \left\{\mu_{N}(x), \mu_{N}(y)\right\}$ for all $x$ and $y$ in F. And $v_{N}\left(x y^{-1}\right)=\max \left\{v_{N}\left(x y^{-1}\right), v_{P}\left(e_{2}^{\prime} e_{2}^{\prime}\right)\right\}=v_{N \times P}\left(\left(x y^{-1}\right),\left(e_{2}^{\prime} e_{2}^{\prime}\right)\right)=v_{N \times P}\left[\left(x, e_{2}^{\prime}\right)\left(y^{-1}, e_{2}^{\prime}\right)\right] \leq \max \left\{v_{\mathrm{N} \times \mathrm{P}}\left(\mathrm{x}, \mathrm{e}_{2}^{\prime}\right)\right.$, $\left.v_{N \times P}\left(y^{-1}, e_{2}^{\prime}\right)\right\}=\max \left\{\max \left\{v_{N}(x), v_{P}\left(e_{2}^{\prime}\right)\right\}, \max \left\{v_{N}(y), v_{P}\left(e_{2}^{\prime}\right)\right\}\right\}=\max \left\{v_{N}(x), v_{N}(y)\right\}$. Therefore $v_{N}\left(x y^{-1}\right) \leq \max \left\{v_{N}(x)\right.$, $\left.v_{N}(y)\right\}$ for all $x$ and $y$ in $F$. Hence $N$ is an intuitionistic fuzzy subgroup of $F$. (iii) From (i) and (ii), $A$ is an intuitionistic fuzzy subbigroup of G. (iv) Let $x$ and $y$ be in I and $e_{1}$ be in E. Then ( $\left.e_{1}, x\right)$ and ( $e_{1}, y$ ) are in E×I. Using the property $\mu_{\mathrm{O}}(\mathrm{x}) \leq \mu_{\mathrm{M}}\left(\mathrm{e}_{1}\right), v_{\mathrm{O}}(\mathrm{x}) \geq v_{M}\left(\mathrm{e}_{1}\right)$, we get $\mu_{\mathrm{O}}(\mathrm{x}-\mathrm{y})=\min \left\{\mu_{\mathrm{O}}(\mathrm{x}-\mathrm{y}), \mu_{\mathrm{M}}\left(\mathrm{e}_{1}+\mathrm{e}_{1}\right)\right\}=\mu_{\mathrm{M} \times \mathrm{O}}\left(\left(\mathrm{e}_{1}+\mathrm{e}_{1}\right)\right.$, $\left.(\mathrm{x}-\mathrm{y})\right)=$ $\mu_{M \times O}\left[\left(e_{1}, x\right)+\left(e_{1},-y\right)\right] \geq \min \left\{\mu_{M \times O}\left(e_{1}, x\right), \mu_{M \times O}\left(e_{1},-y\right)\right\}=\min \left\{\min \left\{\mu_{M}\left(e_{1}\right), \mu_{O}(x)\right\}, \min \left\{\mu_{M}\left(e_{1}\right), \mu_{O}(y)\right\}\right\}=\min \left\{\mu_{O}(x)\right.$, $\left.\mu_{0}(y)\right\}$. Therefore $\mu_{0}(x-y) \geq \min \left\{\mu_{0}(x), \mu_{0}(y)\right\}$ for all $x$ and $y$ in I. And $v_{0}(x-y)=\max \left\{v_{0}(x-y), v_{M}\left(e_{1}+e_{1}\right)\right\}=$ $v_{M \times O}\left(\left(e_{1}+e_{1}\right),(x-y)\right)=v_{M \times O}\left[\left(e_{1}, x\right)+\left(e_{1},-y\right)\right] \leq \max \left\{v_{M \times O}\left(e_{1}, x\right), v_{M \times O}\left(e_{1},-y\right)\right\}=\max \left\{\max \left\{v_{M}\left(e_{1}\right), v_{O}(x)\right\}, \max \left\{v_{M}\left(e_{1}\right)\right.\right.$, $\left.\left.v_{\mathrm{O}}(\mathrm{y})\right\}\right\}=\max \left\{v_{\mathrm{O}}(\mathrm{x}), v_{\mathrm{O}}(\mathrm{y})\right\}$. Therefore $v_{\mathrm{O}}(\mathrm{x}-\mathrm{y}) \leq \max \left\{v_{\mathrm{O}}(\mathrm{x}), v_{\mathrm{O}}(\mathrm{y})\right\}$ for all x and y in I . Hence O is an intuitionistic fuzzy subgroup of $I$ (v) Let $x$ and $y$ be in $J$ and $e_{1}{ }^{1}$ be in F. Then ( $e_{1}{ }^{\prime}, x$ ) and ( $e_{1}{ }^{1}, y$ ) are in $F \times J$. Using the property $\mu_{P}(x) \leq \mu_{N}\left(e_{1}{ }^{\prime}\right), v_{P}(x) \geq v_{N}\left(e_{1}{ }^{\prime}\right)$, we get $\mu_{P}\left(x^{-1}\right)=\min \left\{\mu_{P}\left(x^{-1}\right), \mu_{N}\left(e_{1}{ }^{\prime} e_{1}{ }^{\prime}\right)\right\}=\mu_{N \times P}\left(\left(e_{1}{ }^{\prime} e_{1}{ }^{\prime}\right),\left(x y^{-1}\right)\right)=\mu_{N \times P}\left[\left(e_{1}{ }^{\prime}, x\right)\left(e_{1}{ }^{\prime}, y^{-1}\right)\right]$ $\geq \min \left\{\mu_{N \times P}\left(e_{1}{ }^{\prime}, x\right), \mu_{N \times P}\left(e_{1}{ }^{\prime}, y^{-1}\right)\right\}=\min \left\{\min \left\{\mu_{N}\left(e_{1}{ }^{\prime}\right), \mu_{P}(x)\right\}, \min \left\{\mu_{N}\left(e_{1}{ }^{\prime}\right), \mu_{P}(y)\right\}\right\}=\min \left\{\mu_{P}(x), \mu_{P}(y)\right\}$. Therefore $\mu_{\mathrm{P}}\left(\mathrm{xy}^{-1}\right) \geq \min \left\{\mu_{\mathrm{P}}(\mathrm{x}), \mu_{\mathrm{P}}(\mathrm{y})\right\}$ for all x and y in J . And $v_{\mathrm{P}}\left(\mathrm{xy}^{-1}\right)=\max \left\{v_{\mathrm{P}}\left(\mathrm{xy}^{-1}\right), v_{\mathrm{N}}\left(\mathrm{e}_{1}{ }^{\prime} \mathrm{e}_{1}^{\prime}\right)\right\}=v_{\mathrm{N} \times \mathrm{P}}\left(\left(\mathrm{e}_{1}{ }^{\prime} \mathrm{e}_{1}{ }^{\prime}\right),\left(\mathrm{xy}^{-1}\right)\right)=$ $v_{N \times P}\left[\left(e_{1}{ }^{\prime}, x\right)\left(e_{1}{ }^{\prime}, y^{-1}\right)\right] \leq \max \left\{v_{N \times P}\left(e_{1}{ }^{\prime}, x\right), v_{N \times P}\left(e_{1}{ }^{\prime}, y^{-1}\right)\right\}=\max \left\{\max \left\{v_{N}\left(e_{1}{ }^{\prime}\right), v_{P}(x)\right\}, \max \left\{v_{N}\left(e_{1}{ }^{\prime}\right), v_{P}(y)\right\}\right\}=\max \left\{v_{P}(x)\right.$, $\left.v_{P}(y)\right\}$. Therefore $v_{P}\left(x^{-1}\right) \leq \max \left\{v_{P}(x), v_{P}(y)\right\}$ for all $x$ and $y$ in J. Hence $P$ is an intuitionistic fuzzy subgroup of $J$. (vi) From (iv) and (v), B is an intuitionistic fuzzy subbigroup of H. (vii) is clear.
