---

ABSTRACT

The aim of this paper is to introduce the concept of  $\mu p\hat{g}$  closed and open set and to introduce the  $\mu p\hat{g}$  continuous map and their relations. Various properties and characterizations of  $\mu p\hat{g}$  continuous map and study their basic properties in topological spaces.

**Keywords:**  $\mu p\hat{g}$  closed set,  $\mu p\hat{g}$  open set, regular open,  $\mu p\hat{g}$  continuous map.

---

1. INTRODUCTION

In 2000, M. K. R. S. Veera kumar introduced the concept of  $\mu p$  – closed sets in topological spaces. Later he introduced  $\hat{g}$  closed sets in topological spaces. In this paper I introduce the some properties of  $\mu p\hat{g}$  closed set and continuity in topological spaces.

2. PRELIMINARIES

**Definition 2.1:** A subset A of X is called generalized closed (briefly g-closed) [3] set if  $cl(A) \subseteq U$  whenever  $A \subseteq U$  and U is open in X

**Definition 2.2:** A subset A of X is called regular open (briefly r-open) [5] set if  $A = int(cl(A))$  and regular closed (briefly r-closed) set if  $A = cl(int(A))$ .

**Definition 2.3:** A subset A of X is called pre-open [7] set if  $A \subseteq int(cl(A))$  and pre-closed set if  $cl(int(A)) \subseteq A$

**Definition 2.4:** A subset A of X is called  $\alpha$  – open [8] if  $A \subseteq int(cl(int(A)))$  and  $\alpha$  – closed if  $cl(int(cl(A))) \subseteq A$ .

**Definition 2.5:** A subset A of X is called  $\theta$ -closed [13] if  $A = cl_{\theta}(A)$ , where  $cl_{\theta}(A) = \{x \in X : cl(U) \cap A \neq U \in \tau\}$ .

**Definition 2.6:** A subset A of X is called  $\delta$ - closed [13] if  $A = cl_{\delta}(A)$ , where  $cl_{\delta}(A) = \{x \in X : int(cl(U)) \cap A \neq U \in \tau\}$

**Definition 2.7:** A subset A of X is called  $\delta$ -generalized closed (briefly  $\delta$ -g-closed) [12] if  $cl_{\delta}(A) \subseteq U$  whenever  $A \subseteq U$  and U is open in X.

**Definition 2.8:** A subset A of X is called  $g\alpha^*$  closed set [6] if  $\alpha cl(A) \subseteq int(U)$ , whenever  $A \subseteq U$  and U is  $\alpha$  open in X.

**Definition 2.9:** A subset A of X is called  $\hat{g}$  closed set [15] if  $cl(A) \subseteq U$ , whenever  $A \subseteq U$  and U is semi open in X.

**Definition 2.10:** A subset A of X is called  $g^*$  closed set [14] if  $cl(A) \subseteq U$ , whenever  $A \subseteq U$  and U is  $g$  open in X.

**Definition 2.11:** A subset A of X is called  $gr$  closed set [10] if  $rcl(A) \subseteq U$ , whenever  $A \subseteq U$  and U is open in X.

**Definition 2.12:** A subset A of X is called midly g closed set [9] if  $cl(int(A)) \subseteq U$ , whenever  $A \subseteq U$  and U is  $g$  open in X.

---

**Definition 2.13:** A subset A of X is called \*g closed set [17s] if  $cl(A) \subseteq U$ , whenever  $A \subseteq U$  and U is g open in X.

**Definition 2.14:** A subset A of X is called  $\mu\mathfrak{p}$  closed set[16] if  $\mathfrak{p}cl(A) \subseteq U$ , whenever  $A \subseteq U$  and U is  $g\alpha^*$  open in X.

### 3. On $\mu\mathfrak{p}\hat{g}$ Closed set

**Definition 3.1:** A subset A of a topological space  $(X, \tau)$  is called  $\mu\mathfrak{p}\hat{g}$  closed set if  $\mu\mathfrak{p}cl(A) \subseteq U$ , whenever  $A \subseteq U$  and U is  $\hat{g}$  open in X.

**Theorem 3.2:** Every closed set is  $\mu\mathfrak{p}\hat{g}$  closed set, but not conversely.

**Proof:** Let A be closed set such that  $A \subseteq U$  and U is  $\hat{g}$  open set. Every closed set is  $\mu\mathfrak{p}$  closed set.  $A = Cl(A) \subseteq U \Rightarrow \mu\mathfrak{p}cl(A) \subseteq U$ . Hence  $\mu\mathfrak{p}cl(A) \subseteq U$ , whenever  $A \subseteq U$  and U is  $\hat{g}$  open. Therefore A is  $\mu\mathfrak{p}\hat{g}$  closed set.

**Example 3.3:** Let  $X = \{a, b, c, d\}$ ,  $\tau = \{X, \phi, \{a\}, \{b\}, \{a, b\}, \{a, b, c\}\}$  here  $A = \{c\}$  is  $\mu\mathfrak{p}\hat{g}$  closed but not closed set in X.

**Theorem 3.4:** Every midly g closed set is  $\mu\mathfrak{p}\hat{g}$  closed set.

**Proof:** Let A be midly g closed set such that  $cl(int(A)) \subseteq U$  whenever  $A \subseteq U$  and U is g open.  $A = cl(int(A)) \subseteq U \Rightarrow \mu\mathfrak{p}cl(A) \subseteq U$ . Every g open set is  $\hat{g}$  open. Therefore A is  $\mu\mathfrak{p}\hat{g}$  closed set.

**Theorem 3.5:** Every g closed set is  $\mu\mathfrak{p}\hat{g}$  closed set, but not conversely.

**Proof:** Let A be g closed set such that  $cl(A) \subseteq U$ , whenever  $A \subseteq U$  and U is open. Then  $cl(A) \subseteq U \Rightarrow \mu\mathfrak{p}cl(A) \subseteq U$ . Every open set is  $\hat{g}$  open. Therefore A is  $\mu\mathfrak{p}\hat{g}$  closed set.

**Example 3.6:** Let  $X = \{a, b, c, d\}$ ,  $\tau = \{X, \phi, \{a\}, \{b\}, \{a, b\}, \{a, b, c\}\}$ . Let  $A = \{c\}$  is  $\mu\mathfrak{p}\hat{g}$  closed but not g closed set in X.

**Theorem 3.7:** Every  $g^*$  closed set is  $\mu\mathfrak{p}\hat{g}$  closed set, but not conversely.

**Proof:** Let A be  $g^*$  closed set. Every  $g^*$  closed set is g closed. By theorem 3.5, therefore A is  $\mu\mathfrak{p}\hat{g}$  closed set.

**Example 3.8:** Let  $X = \{a, b, c, d\}$ ,  $\tau = \{X, \phi, \{a\}, \{b\}, \{a, b\}, \{a, b, c\}\}$ . Let  $A = \{c\}$  is  $\mu\mathfrak{p}\hat{g}$  closed but not  $g^*$  closed set in X.

**Theorem 3.9:** Every gr closed set is  $\mu\mathfrak{p}\hat{g}$  closed set, but not conversely.

**Proof:** Let A be gr closed set. Every gr closed set is g closed. By theorem 3.5, A is  $\mu\mathfrak{p}\hat{g}$  closed set.

**Example 3.10:** Let  $X = \{a, b, c, d\}$ ,  $\tau = \{X, \phi, \{a\}, \{b\}, \{a, b\}, \{a, b, c\}\}$ . Let  $A = \{c\}$  is  $\mu\mathfrak{p}\hat{g}$  closed but not gr closed set in X.

**Theorem 3.11:** Every \*g closed set is  $\mu\mathfrak{p}\hat{g}$  closed set, but not conversely.

**Proof:** Let A be \*g closed set such that  $cl(A) \subseteq U$ , whenever  $A \subseteq U$  and U is  $\hat{g}$  open. Then  $cl(A) \subseteq U \Rightarrow \mu\mathfrak{p}cl(A) \subseteq U$ . Therefore A is  $\mu\mathfrak{p}\hat{g}$  closed set.

**Example 3.12:** Let  $X = \{a, b, c, d\}$ ,  $\tau = \{X, \phi, \{a\}, \{b\}, \{a, b\}, \{a, b, c\}\}$ . Let  $A = \{c\}$  is  $\mu\mathfrak{p}\hat{g}$  closed but not \*g closed set in X.

**Theorem 3.13:** Every regular closed set is  $\mu\mathfrak{p}\hat{g}$  closed, but not conversely.

**Proof:** Let A be a regular closed set, such that  $A \subseteq U$  and U is  $\hat{g}$  open set, Every regular closed set is closed. By theorem 3.2 A is  $\mu\mathfrak{p}\hat{g}$  closed set.

**Example 3.14:** Let  $X = \{a, b, c, d\}$ ,  $\tau = \{X, \phi, \{a\}, \{b\}, \{a, b\}, \{a, b, c\}\}$ . Let  $A = \{a, b, d\}$  is  $\mu\mathfrak{p}\hat{g}$  closed but not regular closed.

**Remark:** Every  $\theta$ -closed and  $\delta$ - closed is closed. Therefore every  $\theta$ -closed and  $\delta$ - closed is  $\mu\mathfrak{p}\hat{g}$  closed

**Theorem 3.15:** The Union of two  $\mu\mathfrak{p}\hat{g}$  closed subsets of X is also an  $\mu\mathfrak{p}\hat{g}$  closed subsets of X.

**Proof:** Assume that A and B are  $\mu\mathfrak{p}\hat{g}$  closed sets in X, such that  $A \subseteq U$  and  $B \subseteq U$  and U is  $\hat{g}$  open. Since A and B are  $\mu\mathfrak{p}\hat{g}$  closed set, therefore  $\mu\mathfrak{p}cl(A) \subseteq U$  and  $\mu\mathfrak{p}cl(B) \subseteq U$ . Hence  $\mu\mathfrak{p}cl(A \cup B) = \mu\mathfrak{p}cl(A) \cup \mu\mathfrak{p}cl(B) \subseteq U$ . That is AUB is  $\mu\mathfrak{p}\hat{g}$  closed set.

**Theorem 3.16:** The intersection of two  $\mu\mathfrak{p}\hat{g}$  closed subsets of  $X$  is also an  $\mu\mathfrak{p}\hat{g}$  closed subsets of  $X$ .

**Proof:** Assume that  $A$  and  $B$  are  $\mu\mathfrak{p}\hat{g}$  closed sets in  $X$ , such that  $A \subset U$  and  $B \subset U$  and  $U$  is  $\hat{g}$  open. Since  $A$  and  $B$  are  $\mu\mathfrak{p}\hat{g}$  closed set, therefore  $\mu\mathfrak{p}cl(A) \subset U$  and  $\mu\mathfrak{p}cl(B) \subset U$ . Hence  $\mu\mathfrak{p}cl(A \cap B) = \mu\mathfrak{p}cl(A) \cap \mu\mathfrak{p}cl(B) \subset U$ . That is  $A \cap B$  is  $\mu\mathfrak{p}\hat{g}$  closed set.

**Theorem 3.17:** Let  $A \subseteq B \subseteq \mu\mathfrak{p}cl(A)$  and  $A$  is a  $\mu\mathfrak{p}\hat{g}$  closed subset of  $(X, \tau)$  then  $B$  is also a  $\mu\mathfrak{p}\hat{g}$  closed subset of  $(X, \tau)$ .

**Proof:** Since  $A$  is a  $\mu\mathfrak{p}\hat{g}$  closed subset of  $(X, \tau)$ , So  $\mu\mathfrak{p}cl(A) \subseteq U$ , whenever  $A \subseteq U$ ,  $U$  is  $\hat{g}$  open subset of  $X$ . Let  $A \subseteq B \subseteq \mu\mathfrak{p}cl(A)$ . That is  $\mu\mathfrak{p}cl(A) = \mu\mathfrak{p}cl(B)$ . Let if possible there exists an  $\hat{g}$  open subset  $V$  of  $X$  such that  $B \subseteq V$ . So  $A \subseteq V$  and  $A$  being  $\mu\mathfrak{p}\hat{g}$  closed subset of  $X$ ,  $\mu\mathfrak{p}cl(A) \subseteq V$ . That is  $\mu\mathfrak{p}cl(B) \subseteq V$ . Hence  $B$  is also a  $\mu\mathfrak{p}\hat{g}$  closed subset of  $X$ .

**Theorem 3.18:** Let  $A \subseteq B \subseteq X$ , where  $B$  is  $\hat{g}$  open in  $X$ . If  $A$  is  $\mu\mathfrak{p}\hat{g}$  closed in  $X$ , then  $A$  is  $\mu\mathfrak{p}\hat{g}$  closed in  $B$ .

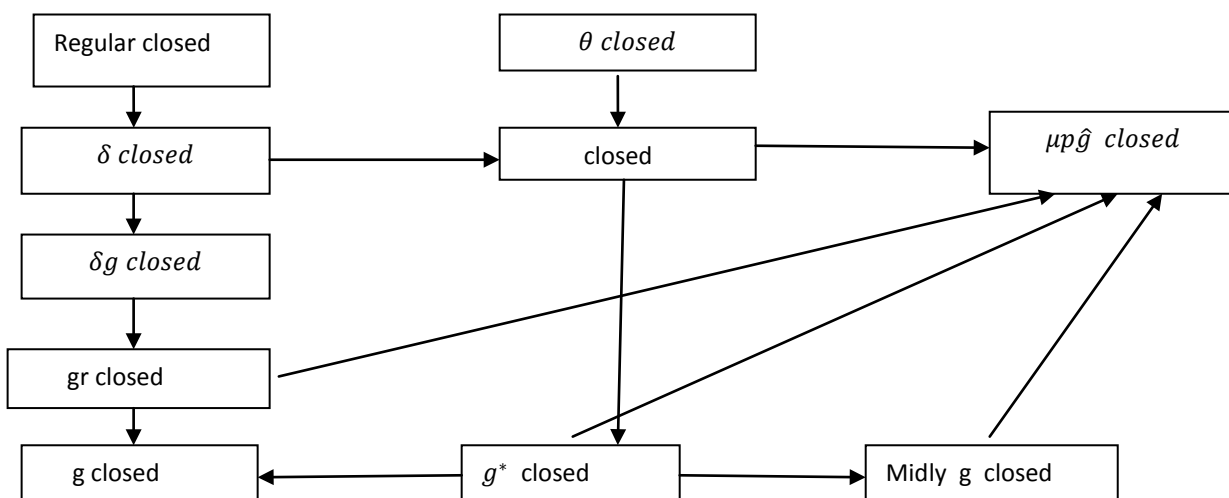

**Proof:** Let  $A \subseteq U$ , where  $U$  is  $\hat{g}$  open set of  $X$ . Since  $U = V \cap B$ , for Some  $\hat{g}$  open set  $V$  of  $X$  and  $B$  is  $\hat{g}$  open in  $X$ . Using assumption  $A$  is  $\mu\mathfrak{p}\hat{g}$  closed in  $X$ . We have  $\mu\mathfrak{p}cl(A) \subseteq U$  and so  $\mu\mathfrak{p}cl(A) = cl(A) \cap B \subseteq U \cap B \subseteq U$ . Hence  $A$  is  $\mu\mathfrak{p}\hat{g}$  closed in  $B$ .

**Theorem 3.19:** A subset  $A$  of  $X$  is  $\mu\mathfrak{p}\hat{g}$  closed sets iff  $\mu\mathfrak{p}cl(A) \cap A^c$  contains no non-zero closed set in  $X$ .

**Proof:** Let  $A$  be a  $\mu\mathfrak{p}\hat{g}$  closed subset of  $X$ . Also if possible let  $M$  be closed subset of  $X$  such that  $M \subseteq \mu\mathfrak{p}cl(A) \cap A^c$ . That is  $M \subseteq \mu\mathfrak{p}cl(A)$  and  $M \subseteq A^c$ . Since  $M$  is a closed subset of  $X$ ,  $M^c$  is an open subset of  $X \subseteq A$ , and  $A$  being  $\mu\mathfrak{p}\hat{g}$  open subset of  $X$ ,  $\mu\mathfrak{p}cl(A) \subseteq M^c$ . But  $M \subseteq \mu\mathfrak{p}cl(A)$ . So we get a contradiction. Therefore  $M = \emptyset$ . So the condition is true. Conversely, let  $A \subseteq N$ , and  $N$  is a open subset of  $X$ . Then  $N^c \subseteq A^c$ , And  $N^c$  is a closed subset of  $X$ . Let if possible  $\mu\mathfrak{p}cl(A) \subseteq N$ . Then  $\mu\mathfrak{p}cl(A) \cap N^c$  is a nonzero closed subset of  $\mu\mathfrak{p}cl(A) \cap A^c$ , which is a contradiction. Hence  $A$  is a  $\mu\mathfrak{p}\hat{g}$  closed subset of  $X$ .

**Theorem 3.20:** A subset  $A$  of  $X$  is  $\mu\mathfrak{p}\hat{g}$  closed set in  $X$  iff  $\mu\mathfrak{p}cl(A) - A$  contain no non-empty  $\hat{g}$  closed set in  $X$ .

**Proof:** Suppose that  $F$  is a non-empty  $\hat{g}$  closed subset of  $\mu\mathfrak{p}cl(A) - A$ . Now  $F \subseteq \mu\mathfrak{p}cl(A) - A$ . Then  $F \subseteq \mu\mathfrak{p}cl(A) \cap A^c$ . Therefore  $F \subseteq A^c$ . Since  $F^c$  is  $\hat{g}$  open set and  $A$  is  $\mu\mathfrak{p}\hat{g}$  closed,  $\mu\mathfrak{p}cl(A) \subseteq F^c$ . That is  $F \subseteq \mu\mathfrak{p}cl(A)^c$ . Hence  $F \subseteq \mu\mathfrak{p}cl(A) \cap [\mu\mathfrak{p}cl(A)]^c = \emptyset$ . That is  $F = \emptyset$ . Thus  $\mu\mathfrak{p}cl(A) - A$  contains no non empty  $\hat{g}$  closed set. Conversely assume that  $\mu\mathfrak{p}cl(A) - A$  contains no nonempty  $\hat{g}$  closed set. Let  $A \subseteq U$ ,  $U$  is  $\hat{g}$  open. Suppose that  $\mu\mathfrak{p}cl(A)$  is not contained in  $U$ . Then  $\mu\mathfrak{p}cl(A) \cap U^c$  is a non-empty  $\hat{g}$  closed set and contained in  $\mu\mathfrak{p}cl(A) - A$ , which is a contradiction. Therefore  $\mu\mathfrak{p}cl(A) \subseteq U$  and hence  $A$  is  $\mu\mathfrak{p}\hat{g}$  closed set.

#### 4. On $\mu\mathfrak{p}\hat{g}$ open set

**Definition 4.1:** A subset  $A$  of a topological space  $X$  is called  $\mu\mathfrak{p}\hat{g}$  open sets if  $A^c$  is  $\mu\mathfrak{p}\hat{g}$  closed.

**Theorem 4.2:** A subset  $A$  of a topological space  $(X, \tau)$  is  $\mu\mathfrak{p}\hat{g}$  open if and only if  $B \subseteq \mu\mathfrak{p}int(A)$  whenever  $B$  is  $\hat{g}$  closed in  $X$  and  $B \subseteq A$ .

**Proof:** Necessity: Suppose  $B \subseteq \mu\mathfrak{p}(\text{int}(A))$  where  $B$  is  $\hat{g}$  closed in  $(X, \tau)$  and  $B \subseteq A$ . Let  $A^c \subseteq M$  where  $M$  is  $\hat{g}$  open. Hence  $M^c \subseteq A$ , where  $M^c$  is  $\hat{g}$  closed. Hence by assumption  $M^c \subseteq \mu\mathfrak{p}(\text{int}(A))$  which implies  $(\mu\mathfrak{p}(\text{int}(A)))^c \subseteq M$ . Therefore  $\mu\mathfrak{p}(\text{cl}(A^c)) \subseteq M$ . Thus  $A^c$  is  $\mu\mathfrak{p}\hat{g}$  closed, implies  $A$  is  $\mu\mathfrak{p}\hat{g}$  open.

Sufficiency: Let  $A$  is  $\mu\mathfrak{p}\hat{g}$  open in  $X$  with  $N \subseteq A$ , Where  $N$  is  $\hat{g}$  closed. We have  $A^c$  is  $\mu\mathfrak{p}\hat{g}$  closed with  $A^c \subseteq N^c$  where  $N^c$  is  $\hat{g}$  open. Then we have  $\mu\mathfrak{p}(\text{cl}(A^c)) \subseteq N^c$  implies  $N \subseteq X - \mu\mathfrak{p}(\text{cl}(A^c)) = \mu\mathfrak{p}(\text{int}(X - A^c)) = \mu\mathfrak{p}(\text{int}(A))$

**Theorem 4.3:** If  $\mu\mathfrak{p}(\text{int}(A)) \subseteq B \subseteq A$  and  $A$  is  $\mu\mathfrak{p}\hat{g}$  open subset of  $(X, \tau)$  then  $B$  is also  $\mu\mathfrak{p}\hat{g}$  open subset of  $(X, \tau)$ .

**Proof:** Let  $\mu\mathfrak{p}(\text{int}(A)) \subseteq B \subseteq A$  implies  $A^c \subseteq B^c \subseteq \mu\mathfrak{p}(\text{cl}(A^c))$ . Given  $A^c$  is  $\mu\mathfrak{p}\hat{g}$  closed. By theorem 3.17,  $B^c$  is  $\mu\mathfrak{p}\hat{g}$  closed. Therefore  $B$  is  $\mu\mathfrak{p}\hat{g}$  open.

**Theorem 4.4:** If a subset  $A$  of a topological space  $(X, \tau)$  is  $\mu\mathfrak{p}\hat{g}$  open in  $X$  then  $F=X$ , whenever  $F$  is regular open and  $\mu\mathfrak{p}(\text{int}(A)) \subseteq A^c \subseteq F$ .

**Proof:** Let  $A$  be a  $\mu\mathfrak{p}\hat{g}$  open and  $F$  be  $\hat{g}$  open,  $\mu\mathfrak{p}(\text{int}(A)) \cup A^c \subseteq F$ . This gives  $F^c \subseteq (X - \mu\mathfrak{p}(\text{int}(A))) \cap A = \mu\mathfrak{p}(\text{cl}(A^c)) \cap A = \mu\mathfrak{p}(\text{cl}(A^c)) - A^c$ . Since  $F^c$  is  $\hat{g}$  closed and  $A^c$  is  $\mu\mathfrak{p}\hat{g}$  closed. By theorem 3.19, we have  $F^c = \emptyset$ . Thus  $F=X$ .

**Theorem 4.5:** If a subset  $A$  of a topological space  $(X, \tau)$  is  $\mu\mathfrak{p}\hat{g}$  closed, then  $\mu\mathfrak{p}(\text{cl}(A)) - A$  is  $\mu\mathfrak{p}\hat{g}$  open.

**Proof:** Let  $A \subseteq X$  be a  $\mu\mathfrak{p}\hat{g}$  closed and let  $F$  be  $\hat{g}$  closed such that  $F \subseteq \mu\mathfrak{p}(\text{cl}(A)) - A$ . By theorem 3.19, we have  $F = \emptyset$ . So  $\emptyset = F \subseteq \mu\mathfrak{p}(\text{int}(\mu\mathfrak{p}(\text{cl}(A)) - A))$ . Therefore  $\mu\mathfrak{p}(\text{cl}(A)) - A$  is  $\mu\mathfrak{p}\hat{g}$  open.

**Theorem 4.6:** If  $A$  and  $B$  are  $\mu\mathfrak{p}\hat{g}$  open sets in  $X$  then  $A \cap B$  is also  $\mu\mathfrak{p}\hat{g}$  open sets in  $X$ .

**Proof:** Let  $A$  and  $B$  be two  $\mu\mathfrak{p}\hat{g}$  open sets in  $X$ . Then  $A^c$  and  $B^c$  are  $\mu\mathfrak{p}\hat{g}$  closed sets in  $X$ . By theorem 3.15,  $A^c \cup B^c$  is a  $\mu\mathfrak{p}\hat{g}$  closed in  $X$ . That is  $(A \cap B)^c$  is a  $\mu\mathfrak{p}\hat{g}$  closed in  $X$ . Therefore  $(A \cap B)$  is  $\mu\mathfrak{p}\hat{g}$  open set in  $X$ .

**Theorem 4.7:** If  $A$  and  $B$  are  $\mu\mathfrak{p}\hat{g}$  open sets in  $X$  then  $A \cup B$  also  $\mu\mathfrak{p}\hat{g}$  open set in  $X$ .

**Proof:** Let  $A$  and  $B$  be two  $\mu\mathfrak{p}\hat{g}$  open sets in  $X$ . Then  $A^c$  and  $B^c$  are  $\mu\mathfrak{p}\hat{g}$  closed sets in  $X$ . By theorem 3.16,  $A^c \cap B^c$  is a  $\mu\mathfrak{p}\hat{g}$  closed in  $X$ . That is  $(A \cap B)^c$  is a  $\mu\mathfrak{p}\hat{g}$  closed in  $X$ . Therefore  $A \cup B$  is  $\mu\mathfrak{p}\hat{g}$  open sets in  $X$ .

**Theorem 4.8:**  $A \times B$  is a  $\mu\mathfrak{p}\hat{g}$  open subset of  $(X \times Y, \tau \times \sigma)$ , iff  $A$  is a  $\mu\mathfrak{p}\hat{g}$  open subset in  $(X, \tau)$  and  $B$  is a  $\mu\mathfrak{p}\hat{g}$  open subset in  $(Y, \sigma)$ .

**Proof:** Let  $A \times B$  be a  $\mu\mathfrak{p}\hat{g}$  open subset of  $(X \times Y, \tau \times \sigma)$ . Let  $H$  be a closed subset of  $(X, \tau)$  and  $G$  be a closed subset of  $(Y, \sigma)$  such that  $H \subseteq A, G \subseteq B$ . Then  $H \times G$  is closed in  $(X \times Y, \tau \times \sigma)$  such that  $H \times G \subseteq A \times B$ . By assumption  $A \times B$  is a  $\mu\mathfrak{p}\hat{g}$  open subset of  $(X \times Y, \tau \times \sigma)$  and so  $H \times G \subseteq \mu\mathfrak{p}(\text{int}(A \times B)) \subseteq \mu\mathfrak{p}(\text{int}(A)) \times \mu\mathfrak{p}(\text{int}(B))$ . That is  $H \subseteq \mu\mathfrak{p}(\text{int}(A)), G \subseteq \mu\mathfrak{p}(\text{int}(B))$  and hence  $A$  is a  $\mu\mathfrak{p}\hat{g}$  open subset in  $(X, \tau)$  and  $B$  is a  $\mu\mathfrak{p}\hat{g}$  open subset in  $(Y, \sigma)$ . Conversely, let  $M$  be a closed subset of  $(X \times Y, \tau \times \sigma)$  such that  $M \subseteq A \times B$ . For each  $(x, y) \in M$ ,  $\text{cl}(X) \times \text{cl}(Y) \subseteq \text{cl}(M) = M \subseteq A \times B$ . Then the two closed sets  $\text{cl}(X)$  and  $\text{cl}(Y)$  are contained in  $A$  and  $B$  respectively. By assumption  $\text{cl}(X) \subseteq \mu\mathfrak{p}(\text{int}(A))$  and  $\text{cl}(Y) \subseteq \mu\mathfrak{p}(\text{int}(B))$  hold. This implies that for each  $(x, y) \in M$ ,  $(x, y) \in \mu\mathfrak{p}(\text{int}(A \times B))$ . Thus  $A \times B$  is a  $\mu\mathfrak{p}\hat{g}$  open subset of  $(X \times Y, \tau \times \sigma)$ .

## 5. On $\mu\mathfrak{p}\hat{g}$ continuity

**Definition 5.1:** A map  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called

1. Continuous [3] if  $f^{-1}(V)$  is closed subset in  $(X, \tau)$  for every closed subset  $V$  in  $(Y, \sigma)$ .
2. Midly  $g$  continuous [9] if  $f^{-1}(V)$  is midly  $g$  closed subset in  $(X, \tau)$  for every closed subset  $V$  in  $(Y, \sigma)$ .
3.  $g$  continuous [2] if  $f^{-1}(V)$  is  $g$  closed subset in  $(X, \tau)$  for every closed subset  $V$  in  $(Y, \sigma)$ .
4.  $*g$  continuous [17] if  $f^{-1}(V)$  is  $*g$  closed subset in  $(X, \tau)$  for every closed subset  $V$  in  $(Y, \sigma)$ .
5.  $g^*$  continuous [13] if  $f^{-1}(V)$  is  $g^*$  closed subset in  $(X, \tau)$  for every closed subset  $V$  in  $(Y, \sigma)$ .
6. Regular continuous [1] if  $f^{-1}(V)$  is  $r$  closed subset in  $(X, \tau)$  for every closed subset  $V$  in  $(Y, \sigma)$ .
7.  $gr$  continuous [5] if  $f^{-1}(V)$  is  $gr$  closed subset in  $(X, \tau)$  for every closed subset  $V$  in  $(Y, \sigma)$ .

**Definition 5.2:** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called  $\mu\mathfrak{p}\hat{g}$  continuous if  $f^{-1}(V)$  is  $\mu\mathfrak{p}\hat{g}$  closed subset of  $(X, \tau)$  for every closed subset  $V$  of  $(Y, \sigma)$ .

**Theorem 5.3:** Every continuous map is  $\mu\mathfrak{p}\hat{g}$  continuous, but not conversely.

**Proof:** The proof follows from the fact that every closed set is  $\mu\mathfrak{p}\hat{g}$  closed set.

**Example 5.4:** Let  $X=Y=\{a, b, c, d\}$ ,  $\tau = \{X, \phi, \{a\}, \{b\}, \{a,b\}, \{a,b,c\}\}$  and  $\sigma = \{X, \phi, \{b\}, \{a, b\}\}$ . Define a map  $f : X \rightarrow Y$  by  $f(a) = a, f(b) = c, f(c) = d, f(d) = c$ . This map is  $\mu\mathfrak{p}\hat{g}$  continuous, but not continuous. Since for the closed set  $U = \{d\}$  in  $Y$ ,  $f^{-1}(U) = \{c\}$  is not closed in  $X$ .

**Theorem 5.5:** Every regular continuous map is  $\mu\mathfrak{p}\hat{g}$  continuous, but not conversely.

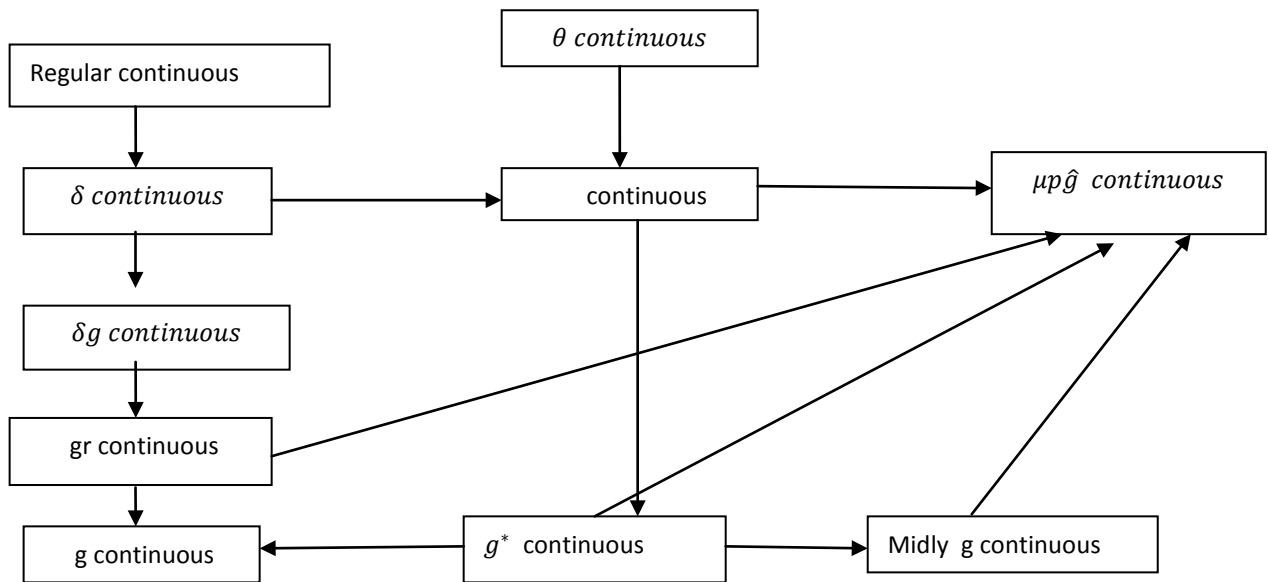

**Proof:** The proof follows from the fact that every regular closed set is  $\mu\mathfrak{p}\hat{g}$  closed set.

**Example 5.6:** Let  $X=Y=\{a, b, c, d\}$ ,  $\tau = \{X, \phi, \{a\}, \{b\}, \{a, b\}, \{a, b, c\}\}$  and  $\sigma = \{X, \phi, \{b\}, \{b, d\}\}$ . Define a map  $f : X \rightarrow Y$  by  $f(a) = a, f(b) = c, f(c) = d, f(d) = c$ . This map is  $\mu\mathfrak{p}\hat{g}$  continuous, but not regular continuous. Since for the closed set  $U = \{d\}$  in  $Y$ ,  $f^{-1}(U) = \{c\}$  is not regular closed in  $X$ .

**Theorem 5.7:** Every  $g$  continuous map is  $\mu\mathfrak{p}\hat{g}$  continuous, but not conversely.

**Proof:** The proof follows from the fact that every  $g$  closed set is  $\mu\mathfrak{p}\hat{g}$  closed set.

**Example 5.8:** Let  $X=Y=\{a, b, c, d\}$ ,  $\tau = \{X, \phi, \{a\}, \{b\}, \{a,b\}, \{a,b, c\}\}$  and  $\sigma = \{X, \phi, \{b\}, \{b, d\}\}$ . Define a map  $f : X \rightarrow Y$  by  $f(a) = b, f(b) = a, f(c) = d, f(d) = c$ . This map is  $\mu\mathfrak{p}\hat{g}$  continuous, but not  $g$  continuous. Since for the closed set  $U = \{d\}$  in  $Y$ ,  $f^{-1}(U) = \{c\}$  is not  $g$  closed in  $X$ .

**Theorem 5.9:** If  $f : X \rightarrow Y$  is  $\mu\mathfrak{p}\hat{g}$  continuous and  $g : Y \rightarrow Z$  is continuous then their composition  $f \circ g : X \rightarrow Z$  is  $\mu\mathfrak{p}\hat{g}$  continuous.

**Proof:** Let  $f : X \rightarrow Y$  is  $\mu\mathfrak{p}\hat{g}$  continuous and  $g : Y \rightarrow Z$  is continuous. Let  $U$  be a closed set in  $Z$ . Therefore  $g^{-1}(U)$  is closed in  $Y$  and  $f^{-1}(g^{-1}(U))$  is  $\mu\mathfrak{p}\hat{g}$  closed in  $X$ .  $\therefore f \circ g$  is  $\mu\mathfrak{p}\hat{g}$  continuous.

**Theorem 5.10:** Let  $X$  and  $Y$  be topological spaces. Let  $f : (X, \tau) \rightarrow (Y, \sigma)$ . Then the following are equivalent.

- (i)  $f$  is  $\mu\mathfrak{p}\hat{g}$  continuous.
- (ii) for every subset  $A$  of  $X$ , one has  $f(\overline{A}) \subset \overline{f(A)}$ .
- (iii) for every closed set  $B$  of  $Y$ , the set  $f^{-1}(B)$  is closed in  $X$ .
- (iv) for each  $x \in X$  and each neighborhood  $V$  of  $f(x)$ , there is a neighborhood  $U$  of  $x$  such that  $f(U) \subset V$ .

**Proof:**

**(i)  $\Rightarrow$  (ii):** Assume that  $f$  is  $\mu\mathfrak{p}\hat{g}$  continuous. Let  $A$  be a subset of  $X$ . Let  $V$  be a neighborhood of  $f(x)$ , then  $f^{-1}(V)$  is an open set of  $X$  containing  $x$ , it must intersect  $A$  in some point  $y$ . Then  $V$  intersects  $f(A)$  in the point  $f(y)$ . So that  $f(x) \in \overline{f(A)}$

**(ii)  $\Rightarrow$  (iii):** Let  $B$  be closed in  $Y$  and let  $A = f^{-1}(B)$ . Prove that,  $A$  is closed in  $X$  and we show that  $\overline{A} = A$ . By elementary set theory, we have  $f(A) = f(f^{-1}(A)) \subset B$ , If  $x \in \overline{A}$ ,  $f(x) \in f(\overline{A}) \subset \overline{f(A)} \subset \overline{B} = B$ .  $f(x) \in B$ , so that  $x \in f^{-1}(B) = A$ . Thus  $\overline{A} \subset A$ , So that  $\overline{A} = A$ .

(iii) $\Rightarrow$ (i): Let  $V$  be an open set of  $Y$  set  $B=Y-V$ . Then  $f^{-1}(B) = f^{-1}(Y-V) = f^{-1}(Y)-f^{-1}(V)=X-f^{-1}(V)$ . Now  $B$  is a closed set of  $Y$ . Then  $f^{-1}(B)$  is closed in  $X$  by hypothesis so that  $f^{-1}(V)$  is open in  $X$ .

(i) $\Rightarrow$ (iv): Let  $x \in X$  and let  $V$  be a neighborhood of  $f(x)$ . Then the set  $U = f^{-1}(V)$  is a neighborhood of  $x$  such that  $f(U) \subset V$ .

(iv) $\Rightarrow$ (i): Let  $V$  be an open set of  $Y$ . Let  $x$  be a point of  $f^{-1}(V)$ . Then  $f(x) \in V$ , so that by hypothesis there is a neighborhood  $U_x$  of  $x$  such that  $f(U_x) \subset V$ . Then  $U_x \subset f^{-1}(V)$ , and hence  $f^{-1}(V) = \bigcup_{x \in f^{-1}(V)} U_x$ . Therefore  $f$  is continuous  $\Rightarrow f$  is  $\mu\mathfrak{p}\hat{g}$  continuous.

**Theorem 5.16:** Let  $X=A \cup B$ , where  $A$  and  $B$  are closed in  $X$ . Let  $f : A \rightarrow Y$  and  $g : B \rightarrow Y$  be continuous. If  $f(x) = g(x)$  for every  $x \in A \cap B$  then  $f$  and  $g$  combine to give a  $\mu\mathfrak{p}\hat{g}$  continuous function  $h: X \rightarrow Y$  defined by setting  $h(x) = f(x)$  if  $x \in A$ , and  $h(x) = g(x)$  if  $x \in B$ .

**Proof:** Let  $c$  be a closed subset of  $Y$ . Now  $h^{-1}(c) = f^{-1}(c) \cup g^{-1}(c)$ . Since  $f$  is continuous,  $f^{-1}(c)$  is closed in  $A$  and therefore closed in  $X$ . Similarly  $g^{-1}(c)$  is closed in  $B$  and therefore closed in  $X$ . Their union  $h^{-1}(c)$  is also closed in  $X$ . Therefore  $h$  is continuous. By theorem 5.3,  $h$  is  $\mu\mathfrak{p}\hat{g}$  continuous.

**Theorem 5.17:** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  from a topological space  $X$  into a topological space  $Y$  is  $\mu\mathfrak{p}\hat{g}$  continuous if and only if  $f^{-1}(V)$  is  $\mu\mathfrak{p}\hat{g}$  open set in  $X$  for every open set  $V$  in  $Y$

**Proof:** It is obvious

**Theorem 5.18:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a function from a topological space  $X$  into a topological space  $Y$ . If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is continuous then  $f(\mu\mathfrak{p}\hat{g}cl(A)) \subseteq cl(f(A))$  for every open subset  $A$  of  $X$ .

**Proof:** Since  $f(A) \subseteq cl(f(A)) \Rightarrow A \subseteq f^{-1}(cl(f(A)))$ . Since  $cl(f(A))$  is closed set in  $Y$  and  $f$  is  $\mu\mathfrak{p}\hat{g}$  continuous, then  $f^{-1}(cl(f(A)))$  is a  $\mu\mathfrak{p}\hat{g}$  closed set in  $X$  containing  $A$ . Hence  $\mu\mathfrak{p}\hat{g}cl(A) \subseteq f^{-1}(cl(f(A)))$ . Therefore  $f(\mu\mathfrak{p}\hat{g}cl(A)) \subseteq cl(f(A))$

**Theorem 5.19:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a function from a topological space  $X$  into a topological space  $Y$ . Then the following statements are equivalent.

- (i) For each point  $x$  in  $X$  and each open set  $V$  in  $Y$  with  $f(x) \in V$ , there is a  $\mu\mathfrak{p}\hat{g}$  open set  $U$  in  $X$  such that  $x \in U$  and  $f(U) \subseteq V$
- (ii) For each subset  $A$  of  $X$ ,  $f(\mu\mathfrak{p}\hat{g}cl(A)) \subseteq cl(f(A))$
- (iii) For each subset  $B$  of  $Y$ ,  $\mu\mathfrak{p}\hat{g}cl(f^{-1}(B)) \subseteq f^{-1}(cl(B))$

**Proof:**

(i)  $\Rightarrow$  (ii): Suppose that (i) holds and let  $y \in f(\mu\mathfrak{p}\hat{g}cl(A))$  and let  $V$  be any open neighborhood of  $y$ . Since  $y \in f(\mu\mathfrak{p}\hat{g}cl(A)) \Rightarrow \exists x \in \mu\mathfrak{p}\hat{g}cl(A)$  such that  $f(x) = y$ . Since  $f(x) \in V$ , then by (i)  $\exists$  a  $\mu\mathfrak{p}\hat{g}$  open set  $U$  in  $X$  such that  $x \in U$  and  $f(U) \subseteq V$ . Since  $x \in \mu\mathfrak{p}\hat{g}cl(A)$  then for any  $x \in X$   $x \in \mu\mathfrak{p}\hat{g}cl(A)$  if and only if  $U \cap A \neq \emptyset$  for every  $\mu\mathfrak{p}\hat{g}$  open set  $U$  containing  $x$ , and hence  $f(A) \cap V \neq \emptyset$ . Therefore we have  $y = f(x) \in cl(f(A))$ . Hence  $f(\mu\mathfrak{p}\hat{g}cl(A)) \subseteq cl(f(A))$ .

(ii)  $\Rightarrow$  (i): If (ii) holds and let  $x \in X$  and  $V$  be any open set in  $Y$  containing  $f(x)$ . Let  $A = f^{-1}(V^c) \Rightarrow x \notin A$ . Since  $f(\mu\mathfrak{p}\hat{g}cl(A)) \subseteq cl(f(A)) \subseteq V^c \Rightarrow \mu\mathfrak{p}\hat{g}cl(A) \subseteq f^{-1}(V^c) = A$ . Since  $x \notin A \Rightarrow x \notin \mu\mathfrak{p}\hat{g}cl(A)$  then for any  $x \in X$ ,  $x \in \mu\mathfrak{p}\hat{g}cl(A)$  if and only if  $U \cap A \neq \emptyset$ , there exists a  $\mu\mathfrak{p}\hat{g}$  open set  $U$  containing  $x$  such that  $U \cap A = \emptyset$  and hence  $f(U) \subseteq f(A^c) \subseteq V$ .

(ii)  $\Rightarrow$  (iii): Suppose that (ii) holds and let  $B$  be any subset of  $Y$ . Replacing  $A$  by  $f^{-1}(B)$  we get from (ii),  $f(\mu\mathfrak{p}\hat{g}cl(f^{-1}(B))) \subseteq cl(f(f^{-1}(B))) \subseteq cl(B)$ . Hence  $\mu\mathfrak{p}\hat{g}cl(f^{-1}(B)) \subseteq f^{-1}(cl(B))$ .

(iii)  $\Rightarrow$  (ii): Suppose that (iii) holds. Let  $B = f(A)$  where  $A$  is a subset of  $X$ . then we get from (iii)  $\mu\mathfrak{p}\hat{g}cl(A) \subseteq \mu\mathfrak{p}\hat{g}cl(f^{-1}(f(A))) \subseteq f^{-1}(cl(f(A)))$ . Therefore  $f(\mu\mathfrak{p}\hat{g}cl(A)) \subseteq cl(f(A))$ .

**Theorem 5.20:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a function. Then the following are equivalent.

- (i)  $f$  is  $\mu\mathfrak{p}\hat{g}$  continuous.
- (ii) The inverse image of each open set in  $Y$  is  $\mu\mathfrak{p}\hat{g}$  open in  $X$ .
- (iii) The inverse image of each closed set in  $Y$  is  $\mu\mathfrak{p}\hat{g}$  closed in  $X$ .

**Proof:** (i)  $\Rightarrow$  (ii): Let  $G$  be any open set in  $Y$ . Then  $Y-G$  is closed in  $Y$ . Since  $f$  is  $\mu\mathfrak{p}\hat{g}$  continuous,  $f^{-1}(Y-G)$  is closed in  $X$ . But  $f^{-1}(Y-G) = X - f^{-1}(G)$  is  $\mu\mathfrak{p}\hat{g}$  closed in  $X$ . Therefore  $f^{-1}(G)$  is  $\mu\mathfrak{p}\hat{g}$  open in  $X$ .

(ii)  $\Rightarrow$  (iii) and (iii)  $\Rightarrow$  (i) are obvious.
