ABSTRACT

In this paper we introduce and study a new class of generalized closed sets called  $\psi^*\alpha$ -closed sets in topological spaces. We analyze the relations between  $\psi^*\alpha$ -closed sets with already existing closed sets. We discuss some basic properties of  $\psi^*\alpha$ -closed sets. The class of  $\psi^*\alpha$ -closed sets is properly placed between the class of  $\alpha$ -closed sets and the class of  $\tilde{g}_\alpha$  (resp.  $\psi$ )-closed sets. We prove that the class of  $\psi^*\alpha$ -closed sets form a topology.

**Keywords:**  $\alpha$ -closed sets,  $\psi$ -closed sets,  $\psi g$ -closed sets and  $\psi^*\alpha$ -closed sets

---

1. INTRODUCTION

Njastad [18] introduced the concept of an  $\alpha$ -open sets. Levine [13] introduced the notion of  $g$ -closed sets in topological spaces and studied their basic properties. Veerakumar [22] introduced and studied  $\psi$ -closed sets in topological spaces. Ramya and Parvathi [20] introduced a new concept of generalized closed sets called  $\psi\tilde{g}$ -closed sets and  $\psi g$ -closed sets in topological spaces. Jafari *et.al*[10] introduced the class of  $\tilde{g}_\alpha$ -closed sets. In this paper we introduce a new class of generalized closed sets called  $\psi^*\alpha$ -closed sets in topological spaces. This class is obtained by generalizing  $\alpha$ -closed sets via  $\psi g$ -open sets.

2. PRELIMINARIES

Throughout this paper  $(X, \tau)$  represents non-empty topological space on which no separation axioms are defined, unless otherwise mentioned. The interior, closure and complement of a subset  $A$  of a space  $(X, \tau)$  are denoted by  $\text{int}(A)$ ,  $\text{cl}(A)$  and  $A^c$  respectively.

**Definition 2.1:** A subset  $A$  of a topological space  $(X, \tau)$  is called

- (i) Semi-open set [12] if  $A \subseteq \text{cl}(\text{int}(A))$
- (ii)  $\alpha$ -open set [18] if  $A \subseteq \text{int}(\text{cl}(\text{int}(A)))$
- (iii) Pre-open set [17] if  $A \subseteq \text{int}(\text{cl}(A))$
- (iv) semi pre-open set [3] if  $A \subseteq \text{cl}(\text{int}(\text{cl}(A)))$

The complements of the above mentioned sets are called semi-closed,  $\alpha$ -closed, pre-closed and semi pre-closed sets respectively

The intersection of all semi-closed (resp.  $\alpha$ -closed, pre-closed and semi pre-closed) subsets of  $(X, \tau)$  containing  $A$  is called the semi-closure (resp.  $\alpha$ -closure, pre-closure and semi pre-closure) of  $A$  and is denoted by  $\text{scl}(A)$  (resp.  $\alpha\text{cl}(A)$ ,  $\text{pcl}(A)$  and  $\text{spcl}(A)$ ). A subset  $A$  of  $(X, \tau)$  is called nowhere dense if  $\text{int}(\text{cl}(A)) = \emptyset$ . A subset  $A$  of a topological space  $(X, \tau)$  is called semi-closed (resp.  $\alpha$ -closed) if and only if  $\text{scl}(A) = A$  (resp.  $\alpha\text{cl}(A) = A$ )

**Definition 2.2:** A subset A of a topological space  $(X, \tau)$  is called

- (a) generalized closed set (briefly g-closed) [13] if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ .
  - (b) generalized semi-closed set (briefly gs-closed) [4] if  $\text{scl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ .
  - (c) semi-generalized closed set (briefly sg-closed) [5] if  $\text{scl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is semi-open in  $(X, \tau)$ .
  - (d) generalized  $\alpha$ -closed set (briefly  $\alpha$ g-closed) [14] if  $\alpha\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\alpha$ -open in  $(X, \tau)$ .
  - (e)  $\alpha$ -generalized closed set (briefly  $\alpha$ g-closed) [15] if  $\alpha\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ .
  - (f) generalized semi-pre-closed set (briefly gsp-closed) [7] if  $\text{spcl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ .
  - (g)  $\hat{g}$ -closed set [24] if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is semi-open in  $(X, \tau)$ .
  - (h)  $g^*$ -closed set [23] if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $g$ -open in  $(X, \tau)$ .
  - (i)  $g^*$ -closed set [30] if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\hat{g}$ -open in  $(X, \tau)$ .
  - (j) gp-closed set [16] if  $\text{pcl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ .
  - (k)  $g^*p$ -closed set [25] if  $\text{pcl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $g$ -open in  $(X, \tau)$ .
  - (l)  $\alpha\hat{g}$ -closed set [1] if  $\alpha\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\hat{g}$ -open in  $(X, \tau)$ .
  - (m)  $\alpha$ gs-closed set [19] if  $\alpha\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is semi-open in  $(X, \tau)$ .
  - (n)  $g^\#$ s-closed set [26] if  $\text{scl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\alpha$ g-open in  $(X, \tau)$ .
  - (o)  $^\#$ gs-closed set [29] if  $\text{scl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $g^*$ -open in  $(X, \tau)$ .
  - (p)  $\tilde{g}$ -closed set [9] if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $^\#$ gs-open in  $(X, \tau)$ .
  - (q)  $\tilde{g}_\alpha$ -closed set [10] if  $\alpha\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $^\#$ gs-open in  $(X, \tau)$ .
  - (r)  $\tilde{g}$ -semi-closed set [21] if  $\text{scl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $^\#$ gs-open in  $(X, \tau)$ .
  - (s)  $\tilde{g}$ -pre closed set [8] if  $\text{pcl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $^\#$ gs-open in  $(X, \tau)$ .
  - (t)  $g^\#$ -closed set [27] if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\alpha$ g-open in  $(X, \tau)$ .
  - (u)  $g^\#p^\#$ -closed set [2] if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $g^\#$ -open in  $(X, \tau)$ .
  - (v)  $\psi$ -closed set [22] if  $\text{scl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is sg-open in  $(X, \tau)$ .
  - (w)  $\psi$ g-closed set [20] if  $\psi\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ .
  - (x)  $g^*\psi$ -closed set [28] if  $\psi\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $g$ -open in  $(X, \tau)$ .
  - (y)  $\psi\hat{g}$ -closed set [20] if  $\psi\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\hat{g}$ -open in  $(X, \tau)$ .
  - (z)  $\alpha\psi$ -closed set [6] if  $\psi\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\alpha$ -open in  $(X, \tau)$ .
- The complements of the above mentioned sets are called their respective open-sets.

### 3. $\psi^*\alpha$ -CLOSED SETS

**Definition 3.1:** A subset A of a topological space  $(X, \tau)$  is said to be  $\psi^*\alpha$ -closed set if  $\alpha\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\psi$ g-open in  $(X, \tau)$ .

The class of all  $\psi^*\alpha$ -closed sets of  $(X, \tau)$  is denoted by  $\psi^*\alpha C(X, \tau)$ .

**Proposition 3.2:** Every closed set in  $(X, \tau)$  is  $\psi^*\alpha$ -closed but not conversely.

**Proof:** Let A be a closed set and U be any  $\psi$ g-open set containing A in X. Since every closed set is  $\alpha$ -closed,  $\alpha\text{cl}(A) \subseteq \text{cl}(A) = A \subseteq U$ . Therefore A is  $\psi^*\alpha$ -closed.

**Example 3.3:** Let  $X = \{a, b, c\}$ ,  $\tau = \{\emptyset, \{a\}, \{a, b\}, X\}$ . Then the subset  $\{b\}$  is  $\psi^*\alpha$ -closed but not closed in  $(X, \tau)$ .

**Proposition 3.4:** Every  $\alpha$ -closed set in  $(X, \tau)$  is  $\psi^*\alpha$ -closed but not conversely.

**Proof:** Let A be an  $\alpha$ -closed set and U be any  $\psi$ g-open set containing A in X. Since A is  $\alpha$ -closed,  $\alpha\text{cl}(A) = A$ ,  $\alpha\text{cl}(A) = A \subseteq U$ . Therefore A is  $\psi^*\alpha$ -closed.

**Example 3.5:** Let  $X = \{a, b, c\}$ ,  $\tau = \{\emptyset, \{a, b\}, X\}$ . Then the subset  $\{a, c\}$  is  $\psi^*\alpha$ -closed but not  $\alpha$ -closed in  $(X, \tau)$ .

**Lemma 3.6:** Every  $^\#$ gs-closed set in  $(X, \tau)$  is  $\psi$ g-closed but not conversely.

**Proof:** Let A be a  $^\#$ gs-closed set and U be any open set containing A in X. Since every open set is  $g^*$ -open and A is  $^\#$ gs-closed,  $\text{scl}(A) \subseteq U$ . For every subset A of X,  $\psi\text{cl}(A) \subseteq \text{scl}(A)$  and so  $\psi\text{cl}(A) \subseteq U$ . Hence A is  $\psi$ g-closed.

**Example 3.7:** Let  $X = \{a, b, c\}$ ,  $\tau = \{\emptyset, \{a\}, X\}$ . Then the subset  $\{a, b\}$  is  $\psi$ g-closed but not  $^\#$ gs-closed in  $(X, \tau)$ .

**Proposition 3.8:** Every  $\psi^*\alpha$ -closed set in  $(X, \tau)$  is  $\tilde{g}_\alpha$ -closed but not conversely.

**Proof:** Let A be a  $\psi^*\alpha$ -closed set and U be any  $^\#$ gs-open set containing A in X. Since every  $^\#$ gs-open set is  $\psi$ g-open and A is  $\psi^*\alpha$ -closed,  $\alpha\text{cl}(A) \subseteq U$ . Hence A is  $\tilde{g}_\alpha$ -closed.

**Example 3.9:** Let  $X=\{a, b, c, d\}$ ,  $\tau =\{\phi,\{d\},\{a, b\},\{a, b, d\},X\}$ . Then the subset  $\{b, c, d\}$  is  $\tilde{g}_\alpha$ - closed but not  $\psi^* \alpha$ -closed in  $(X, \tau)$ .

**Proposition 3.10:** Every  $\psi^* \alpha$ -closed set in  $(X, \tau)$  is  $g\alpha$ (resp.  $\alpha g$ ,  $sg$ ,  $gs$ ,  $\tilde{g}_s$ )-closed but not conversely.

**Proof:** By [10], every  $\tilde{g}_\alpha$ - closed set is  $g\alpha$  ( resp.  $\alpha g$ ,  $sg$ ,  $gs$ ,  $\tilde{g}_s$ )- closed set. Hence it holds.

**Example 3.11:** Let  $X=\{a, b, c, d\}$ ,  $\tau =\{\phi,\{d\}, \{a, b\}, \{a, b, d\}, X\}$ .Then the subset  $\{a, c, d\}$  is  $g\alpha$ -closed  $\alpha g$ -closed,  $sg$ -closed,  $gs$ -closed and  $\tilde{g}_s$ - closed but not  $\psi^* \alpha$ -closed in  $(X, \tau)$ .

**Proposition 3.12:** Every  $\psi^* \alpha$ -closed set in  $(X, \tau)$  is  $\tilde{g}$ - pre closed but not conversely.

**Proof:** Follows from the fact that every  $\tilde{g}_\alpha$ - closed is  $\tilde{g}$ - pre closed.

**Example 3.13:** Let  $X=\{a, b, c\}$ ,  $\tau =\{\phi,\{a, b\},X\}$ . Then the subset  $\{a\}$  is  $\tilde{g}$ - preclosed but not  $\psi^* \alpha$ -closed in  $(X, \tau)$ .

**Lemma 3.14:** Every semi -closed set in  $(X, \tau)$  is  $\psi g$ -closed but not conversely.

**Proof:** Let  $A$  be a semi- closed set and  $U$  be any open set containing  $A$  in  $X$ . Since  $A$  is semi- closed,  $scl(A)=A$ . For every subset  $A$  of  $X$ ,  $\psi cl(A)\subseteq scl(A)$  and so we have  $\psi cl(A)\subseteq U$ . Hence  $A$  is  $\psi g$ -closed.

**Example 3.15:** Let  $X=\{a, b, c\}$ ,  $\tau =\{\phi,\{a\},X\}$ . Then the subset  $\{a, b\}$  is  $\psi g$ -closed but not semi -closed in  $(X, \tau)$ .

**Proposition 3.16:** Every  $\psi^* \alpha$ -closed set in  $(X, \tau)$  is  $\alpha g s$ -closed but not conversely.

**Proof:** Let  $A$  be a  $\psi^* \alpha$ -closed set and  $U$  be any semi-open set containing  $A$  in  $X$ . Since every semi-open set is  $\psi g$ -open and  $A$  is  $\psi^* \alpha$ -closed,  $\alpha cl(A)\subseteq U$ . Hence  $A$  is  $\alpha g s$ -closed.

**Example 3.17:** Let  $X=\{a, b, c\}$ ,  $\tau =\{\phi,\{a\},\{b, c\},X\}$ .Then the subset  $\{a, c\}$  is  $\alpha g s$ -closed but not  $\psi^* \alpha$ -closed in  $(X, \tau)$ .

**Lemma 3.18:** Every  $g$ -closed set in  $(X, \tau)$  is  $\psi g$ -closed but not conversely.

**Proof:** Let  $A$  be a  $g$ -closed set and  $U$  be any open set containing  $A$  in  $X$ . Since  $A$  is  $g$ -closed,  $cl(A)\subseteq U$ . For every subset  $A$  of  $X$ ,  $\psi cl(A)\subseteq cl(A)$  and so we have  $\psi cl(A)\subseteq U$ . Hence  $A$  is  $\psi g$ -closed.

**Example 3.19:** Let  $X=\{a, b, c\}$ ,  $\tau =\{\phi,\{a\},\{b\},\{a, b\},X\}$ . Then the subset  $\{a\}$  is  $\psi g$ -closed but not  $g$ -closed in  $(X, \tau)$ .

**Proposition 3.20:** Every  $\psi^* \alpha$ -closed set in  $(X, \tau)$  is  $g p$ - closed ( $g^* p$ -closed) but not conversely.

**Proof:** Let  $A$  be a  $\psi^* \alpha$ -closed set and  $U$  be any open ( $g$ -open) set containing  $A$  in  $X$ . Since every open ( $g$ -open) set is  $\psi g$ -open and  $A$  is  $\psi^* \alpha$ -closed,  $\alpha cl(A)\subseteq U$ . For every subset  $A$  of  $X$ ,  $pcl(A)\subseteq \alpha cl(A)$  and so we have  $pcl(A)\subseteq U$ . Hence  $A$  is  $g p$ -closed ( $g^* p$ -closed).

**Example 3.21:** Let  $X=\{a, b, c\}$ ,  $\tau =\{\phi,\{a, b\}, X\}$ . Then the subset  $\{a\}$  is  $g p$ -closed ( $g^* p$ -closed) but not  $\psi^* \alpha$ -closed in  $(X, \tau)$ .

**Lemma 3.22:** Every  $sg$ -closed set in  $(X, \tau)$  is  $\psi g$ - closed but not conversely.

**Proof:** Let  $A$  be a  $sg$ -closed set and  $U$  be any open set containing  $A$  in  $X$ . Since every open set is semi-open and  $A$  is  $sg$ -closed,  $scl(A)\subseteq U$ . For every subset  $A$  of  $X$ ,  $\psi cl(A)\subseteq scl(A)$  and so we have  $\psi cl(A)\subseteq U$ . Hence  $A$  is  $\psi g$ -closed.

**Example 3.23:** Let  $X=\{a, b, c\}$ ,  $\tau =\{\phi,\{a\}, \{a, b\},X\}$ . Then the subset  $\{a, c\}$  is  $\psi g$ -closed but not  $sg$ -closed in  $(X, \tau)$ .

**Proposition 3.24:** Every  $\psi^* \alpha$ -closed set in  $(X, \tau)$  is  $\psi$ -closed but not conversely.

**Proof:** Let  $A$  be a  $\psi^* \alpha$ - closed set and  $U$  be any  $sg$ -open set containing  $A$  in  $X$ . Since every  $sg$ -open set is  $\psi g$ -open and  $A$  is  $\psi^* \alpha$ -closed set,  $\alpha cl(A)\subseteq U$ . For every subset  $A$  of  $X$ ,  $scl(A)\subseteq \alpha cl(A)$  and so we have  $scl(A)\subseteq U$ . Hence  $A$  is  $\psi$ -closed.

**Example 3.25:** Let  $X=\{a, b, c\}$ ,  $\tau =\{\phi,\{a\},\{b\},\{a, b\},X\}$ .Then the subset  $\{a\}$  is  $\psi$ -closed but not  $\psi^* \alpha$ -closed in  $(X, \tau)$ .

**Proposition 3.26:** Every  $\psi^*\alpha$ -closed set in  $(X, \tau)$  is  $\psi\hat{g}$  (resp.  $\psi g, gsp$ )-closed but not conversely.

**Proof:** By [20], every  $\psi$ -closed set is  $\psi\hat{g}$  (resp.  $\psi g, gsp$ )-closed. Therefore it holds

**Example 3.27:** Let  $X=\{a, b, c, d\}$ ,  $\tau=\{\phi, \{a\}, X\}$ . Then the subset  $\{a, b\}$  is  $\psi\hat{g}$ -closed,  $\psi g$ -closed, and  $gsp$ -closed but not  $\psi^*\alpha$ -closed in  $(X, \tau)$ .

**Lemma 3.28:** Every  $\alpha g$ -closed set in  $(X, \tau)$  is  $\psi g$ -closed but not conversely.

**Proof:** Let  $A$  be an  $\alpha g$ -closed set and  $U$  be any open set containing  $A$  in  $X$ . Since  $A$  is  $\alpha g$ -closed,  $\alpha cl(A) \subseteq U$ . For every subset  $A$  of  $X$ ,  $\psi cl(A) \subseteq \alpha cl(A)$  and so  $\psi cl(A) \subseteq U$ . Hence  $A$  is  $\psi g$ -closed.

**Example 3.29:** Let  $X=\{a, b, c\}$ ,  $\tau=\{\phi, \{a\}, \{b\}, \{a, b\}, X\}$ . Then the subset  $\{a\}$  is  $\psi g$ -closed but not  $\alpha g$ -closed in  $(X, \tau)$ .

**Lemma 3.30:** Every  $g\alpha$ -closed set in  $(X, \tau)$  is  $\psi g$ -closed but not conversely.

**Proof:** Let  $A$  be a  $g\alpha$ -closed set and  $U$  be any open set containing  $A$  in  $X$ . Since every open set is  $\alpha$ -open and  $A$  is  $g\alpha$ -closed,  $\alpha cl(A) \subseteq U$ . For every subset  $A$  of  $X$ ,  $\psi cl(A) \subseteq \alpha cl(A)$  and so  $\psi cl(A) \subseteq U$ . Hence  $A$  is  $\psi g$ -closed.

**Example 3.31:** Let  $X=\{a, b, c\}$ ,  $\tau=\{\phi, \{a\}, \{a, b\}, X\}$ . Then the subset  $\{a, c\}$  is  $\psi g$ -closed but not  $g\alpha$ -closed in  $(X, \tau)$ .

**Proposition 3.32:** Every  $\psi^*\alpha$ -closed set in  $(X, \tau)$  is  $g^\#s$ -closed but not conversely.

**Proof:** Let  $A$  be a  $\psi^*\alpha$ -closed set and  $U$  be any  $\alpha g$ -open set containing  $A$  in  $X$ . Since every  $\alpha g$ -open set is  $\psi g$ -open and  $A$  is  $\psi^*\alpha$ -closed,  $\alpha cl(A) \subseteq U$ . For every subset  $A$  of  $X$ ,  $scl(A) \subseteq \alpha cl(A)$  and so  $scl(A) \subseteq U$ . Hence  $A$  is  $g^\#s$ -closed.

**Example 3.33:** Let  $X=\{a, b, c\}$ ,  $\tau=\{\phi, \{a\}, \{b\}, \{a, b\}, X\}$ . Then the subset  $\{a\}$  is  $g^\#s$ -closed but not  $\psi^*\alpha$ -closed in  $(X, \tau)$ .

**Lemma 3.34:** Every  $\hat{g}$ -closed set in  $(X, \tau)$  is  $\psi g$ -closed but not conversely.

**Proof:** Let  $A$  be a  $\hat{g}$ -closed set and  $U$  be any open set containing  $A$  in  $X$ . Since every open set is semi open and  $A$  is  $\hat{g}$ -closed,  $cl(A) \subseteq U$ . For every subset  $A$  of  $X$ ,  $\psi cl(A) \subseteq cl(A)$  and so we have  $\psi cl(A) \subseteq U$ . Hence  $A$  is  $\psi g$ -closed.

**Example 3.35:** Let  $X=\{a, b, c\}$ ,  $\tau=\{\phi, \{a\}, X\}$ . Then the subset  $\{a, b\}$  is  $\psi g$ -closed but not  $\hat{g}$ -closed in  $(X, \tau)$ .

**Proposition 3.36:** Every  $\psi^*\alpha$ -closed set in  $(X, \tau)$  is  $\alpha\hat{g}$ -closed but not conversely.

**Proof:** Let  $A$  be a  $\psi^*\alpha$ -closed set and  $U$  be any  $\hat{g}$ -open set containing  $A$  in  $X$ . Since every  $\hat{g}$ -open set is  $\psi g$ -open and  $A$  is  $\psi^*\alpha$ -closed,  $\alpha cl(A) \subseteq U$ . Hence  $A$  is  $\alpha\hat{g}$ -closed.

**Example 3.37:** Let  $X=\{a, b, c\}$ ,  $\tau=\{\phi, \{a\}, \{a, b\}, X\}$ . Then the subset  $\{a, c\}$  is  $\alpha\hat{g}$ -closed but not  $\psi^*\alpha$ -closed in  $(X, \tau)$ .

**Lemma 3.38:** Every  $^*g$ -closed set in  $(X, \tau)$  is  $\psi g$ -closed but not conversely.

**Proof:** Let  $A$  be a  $^*g$ -closed set and  $U$  be any open set containing  $A$  in  $X$ . Since every open set is  $\hat{g}$ -open and  $A$  is  $^*g$ -closed,  $cl(A) \subseteq U$ . For every subset  $A$  of  $X$ ,  $\psi cl(A) \subseteq cl(A)$  and so we have  $\psi cl(A) \subseteq U$ . Hence  $A$  is  $\psi g$ -closed.

**Example 3.39:** Let  $X=\{a, b, c\}$ ,  $\tau=\{\phi, \{a\}, \{b\}, \{a, b\}, X\}$ . Then the subset  $\{b\}$  is  $\psi g$ -closed but not  $^*g$ -closed in  $(X, \tau)$ .

**Proposition 3.40:** Every  $\psi^*\alpha$ -closed set in  $(X, \tau)$  is  $^\#gs$ -closed but not conversely.

**Proof:** Let  $A$  be a  $\psi^*\alpha$ -closed set and  $U$  be any  $^*g$ -open set containing  $A$  in  $X$ . Since every  $^*g$ -open set is  $\psi g$ -open and  $A$  is  $\psi^*\alpha$ -closed,  $\alpha cl(A) \subseteq U$ . For every subset  $A$  of  $X$ ,  $scl(A) \subseteq \alpha cl(A)$  and so we have  $scl(A) \subseteq U$ . Hence  $A$  is  $^\#gs$ -closed.

**Example 3.41:** Let  $X=\{a, b, c\}$ ,  $\tau=\{\phi, \{a\}, \{a, b\}, X\}$ . Then the subset  $\{a, c\}$  is  $^\#gs$ -closed but not  $\psi^*\alpha$ -closed in  $(X, \tau)$ .

**Proposition 3.42:** Every  $\psi^* \alpha$ -closed set in  $(X, \tau)$  is  $g^* \psi$ -closed but not conversely.

**Proof:** Follows from the fact that every  $\psi$ -closed is  $g^* \psi$ -closed

**Example 3.43:** Let  $X=\{a, b, c, d\}$ ,  $\tau =\{\phi, \{a\}, \{a, b\}, X\}$ . Then the subset  $\{a, c, d\}$  is  $g^* \psi$ -closed but not  $\psi^* \alpha$ -closed in  $(X, \tau)$ .

**Proposition 3.44:** Every  $\psi^* \alpha$ -closed set in  $(X, \tau)$  is  $\alpha \psi$ -closed but not conversely.

**Proof:** Let A be a  $\psi^* \alpha$ -closed set and U be any  $\alpha$ -open set containing A in X. Since every  $\alpha$ -open set is  $\psi g$ -open and A is  $\psi^* \alpha$ -closed,  $\alpha cl(A) \subseteq U$ . For every subset A of X,  $\psi cl(A) \subseteq \alpha cl(A)$ . and so we have  $\psi cl(A) \subseteq U$ . Hence A is  $\alpha \psi$ -closed.

**Example 3.45:** Let  $X=\{a, b, c\}$ ,  $\tau =\{\phi, \{a\}, \{b\}, \{a, b\}, X\}$ . Then the subset  $\{a\}$  is  $\alpha \psi$ -closed but not  $\psi^* \alpha$ -closed in  $(X, \tau)$ .

**Remark 3.46:** The following example shows that  $\psi^* \alpha$ -closedness is independent from g-closedness,  $g^*$ -closedness,  $g^{\#}$ -closedness and  $g^{\#} p^{\#}$ -closedness.

**Example 3.47:** Let  $X=\{a, b, c\}$ ,  $\tau =\{\phi, \{a\}, \{a, b\}, X\}$ . In this topology the set  $\{a, c\}$  is g-closed,  $g^*$ -closed,  $g^{\#}$ -closed and  $g^{\#} p^{\#}$ -closed but not  $\psi^* \alpha$ -closed. The set  $\{b\}$  is  $\psi^* \alpha$ -closed but not g-closed,  $g^*$ -closed,  $g^{\#}$ -closed and  $g^{\#} p^{\#}$ -closed.

**Remark 3.48:** The following examples show that  $\psi^* \alpha$ -closedness is independent from semi-closedness.

**Example 3.49:** Let  $X=\{a, b, c\}$ ,  $\tau =\{\phi, \{a, b\}, X\}$ . In this topology the set  $\{b, c\}$  is  $\psi^* \alpha$ -closed but not semi-closed.

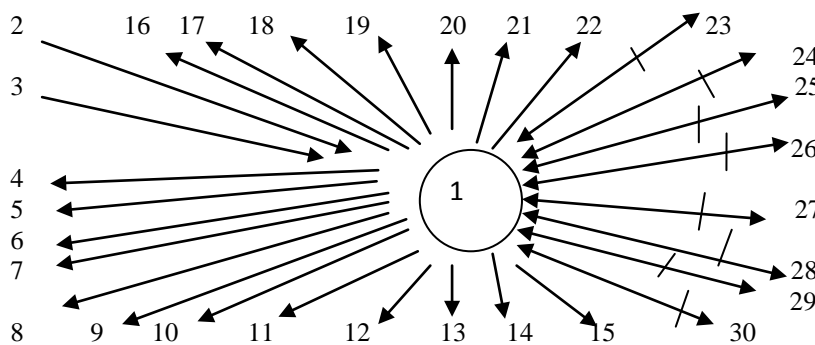

**Example 3.50:** Let  $X=\{a, b, c\}$ ,  $\tau =\{\phi, \{a\}, \{b\}, \{a, b\}, X\}$ . In this topology the set  $\{b\}$  is semi-closed but not  $\psi^* \alpha$ -closed.

**Remark 3.51:** The following examples show that  $\psi^* \alpha$ -closedness is independent from  $\hat{g}$ -closedness,  $g^{\#}$ -closedness and  $\tilde{g}$ -closedness.

**Example 3.52:** Let  $X=\{a, b, c\}$  with  $\tau =\{\phi, \{a\}, \{a, b\}, X\}$ . In this topology the set  $\{b\}$  is  $\psi^* \alpha$ -closed but not  $\hat{g}$ -closed,  $g^{\#}$ -closed and  $\tilde{g}$ -closed.

**Example 3.53:** Let  $X=\{a, b, c, d\}$  with  $\tau =\{\phi, \{d\}, \{a, b\}, \{a, b, d\}, X\}$ . In this topology the set  $\{a, c, d\}$  is  $\hat{g}$ -closed,  $g^{\#}$ -closed and  $\tilde{g}$ -closed but not  $\psi^* \alpha$ -closed.

**Remark 3.54:** The following diagram has shown the relationship of  $\psi^* \alpha$ -closed sets with already existing various closed sets. where  $A \rightarrow B$  represents A implies B but not conversely. where  $A \leftrightarrow B$  represents A and B are independent of each other.

- 1.  $\psi^* \alpha$ -closed
- 2. closed
- 3.  $\alpha$ -closed
- 4.  $\tilde{g}_\alpha$ -closed
- 5.  $g\alpha$ -closed
- 6.  $\alpha g$ -closed
- 7.  $sg$ -closed
- 8.  $gs$ -closed
- 9.  $\tilde{g}$ -semi-closed
- 10.  $\tilde{g}$ -pre-closed
- 11.  $\alpha gs$ -closed
- 12.  $gp$ -closed
- 13.  $g^* p$ -closed
- 14.  $\psi$ -closed
- 15.  $\psi \hat{g}$ -closed
- 16.  $\psi g$ -closed
- 17.  $gsp$ -closed
- 18.  $g^{\#} s$ -closed
- 19.  $\alpha \hat{g}$ -closed
- 20.  $g^{\#} s$ -closed
- 21.  $g^* \psi$ -closed
- 22.  $\alpha \psi$ -closed
- 23.  $g$ -closed
- 24.  $g^*$ -closed
- 25.  $g^{\#}$ -closed
- 26.  $g^{\#} p^{\#}$ -closed
- 27. semi-closed
- 28.  $\hat{g}$ -closed
- 29.  $g^{\#}$ -closed
- 30.  $\tilde{g}$ -closed

**Definition 3.55:** A subset A of a topological space  $(X, \tau)$  is said to be  $\psi^* \alpha$ -open if its complement  $A^c$  is  $\psi^* \alpha$ -closed.

The class of all  $\psi^* \alpha$ -open sets in  $(X, \tau)$  is denoted by  $\psi^* \alpha O(X, \tau)$ .

**Proposition 3.56:** Every open (respectively  $\alpha$ -open) set is  $\psi^* \alpha$ -open.

**Proposition 3.57:** Every  $\psi^* \alpha$ -open set is  $\tilde{g}_\alpha$ -open (respectively  $g\alpha$ -open,  $\alpha g$ -open,  $sg$ -open,  $gs$ -open,  $\tilde{g}$ -semi-open,  $\tilde{g}$ -pre-open,  $\alpha gs$ -open,  $gp$ -open,  $g^*p$ -open,  $\psi$ -open,  $\psi\tilde{g}$ -open,  $\psi g$ -open,  $gsp$ -open,  $g^*s$ -open,  $\alpha\tilde{g}$ -open,  $\#gs$ -open,  $g^*\psi$ -open and  $\alpha\psi$ -open)

#### 4. PROPERTIES OF $\psi^* \alpha$ -CLOSED SETS AND $\psi^* \alpha$ -OPEN SETS

**Theorem 4.1:** If A and B are  $\psi^* \alpha$ -closed sets in a topological space  $(X, \tau)$ , then  $A \cup B$  is  $\psi^* \alpha$ -closed set in  $(X, \tau)$ .

**Proof:** Let A and B be any two  $\psi^* \alpha$ -closed sets in  $(X, \tau)$  and U be any  $\psi g$ -open set containing A and B. We have  $\alpha cl(A) \subseteq U$  and  $\alpha cl(B) \subseteq U$ . Always  $\alpha cl(A \cup B) = \alpha cl(A) \cup \alpha cl(B) \subseteq U$ . Hence  $A \cup B$  is  $\psi^* \alpha$ -closed in  $(X, \tau)$ .

**Theorem 4.2:** Let A be a  $\psi^* \alpha$ -closed set in  $(X, \tau)$ . Then  $\alpha cl(A)-A$  contains no non-empty closed set in  $(X, \tau)$ .

**Proof:** Suppose that A is  $\psi^* \alpha$ -closed. Let F be a closed subset of  $\alpha cl(A)-A$ . Then  $F^c$  is open and hence  $\psi g$ -open such that  $A \subseteq F^c$ . Since A is a  $\psi^* \alpha$ -closed set,  $\alpha cl(A) \subseteq F^c$ . Thus  $F \subseteq (\alpha cl(A))^c$ . Since every closed set is  $\alpha$ -closed, F is  $\alpha$ -closed. Hence  $F \subseteq \alpha cl(A)$ . Therefore  $F \subseteq \alpha cl(A) \cap (\alpha cl(A))^c = \phi$ . Hence  $F = \phi$ .

**Remark 4.3:** The converse of the above theorem is not true as seen from the following example.

**Example 4.4:** Let  $X = \{a, b, c\}$ ,  $\tau = \{\phi, \{a\}, \{b, c\}, X\}$ . If  $A = \{b\}$  then  $\alpha cl(A)-A = \{b, c\} - \{b\} = \{c\}$  does not contain non-empty closed set. However A is not a  $\psi^* \alpha$ -closed subset of  $(X, \tau)$ .

**Theorem 4.5:** A set A is  $\psi^* \alpha$ -closed in  $(X, \tau)$  if and only if  $\alpha cl(A)-A$  contains no non-empty  $\psi g$ -closed set in  $(X, \tau)$ .

**Proof: (Necessity):** Suppose that A is  $\psi^* \alpha$ -closed. Let F be a  $\psi g$ -closed set contained in  $\alpha cl(A)-A$ . Now  $F^c$  is a  $\psi g$ -open set in X such that  $A \subseteq F^c$ . Since A is a  $\psi^* \alpha$ -closed set in X,  $\alpha cl(A) \subseteq F^c$ . Thus  $F \subseteq (\alpha cl(A))^c$ . Also  $F \subseteq \alpha cl(A)-A$ . Therefore  $F \subseteq \alpha cl(A) \cap (\alpha cl(A))^c = \phi$ . Hence  $F = \phi$ .

**Sufficiency:** Suppose that  $\alpha cl(A)-A$  contains no non empty  $\psi g$ -closed set. Let  $A \subseteq G$  and G be  $\psi g$ -open. If  $\alpha cl(A)$  is not a subset of G then  $\alpha cl(A) \cap G^c$  is a non-empty  $\psi g$ -closed subset of  $\alpha cl(A)-A$ , which is a contradiction. Therefore  $\alpha cl(A) \subseteq G$  and hence A is  $\psi^* \alpha$ -closed.

**Proposition 4.6:** If A is  $\psi g$ -open and  $\psi^* \alpha$ -closed subset of  $(X, \tau)$ . Then A is an  $\alpha$ -closed set of  $(X, \tau)$ .

**Proof:** Since A is  $\psi g$ -open and  $\psi^* \alpha$ -closed,  $\alpha cl(A) \subseteq A$ . Hence A is  $\alpha$ -closed.

**Theorem 4.7:** If a set A is  $\psi^* \alpha$ -closed and  $\psi g$ -open and F is  $\alpha$ -closed in  $(X, \tau)$ , then  $A \cap F$  is  $\alpha$ -closed.

**Proof:** Since A is  $\psi^* \alpha$ -closed and  $\psi g$ -open, A is  $\alpha$ -closed by **Proposition 4.6**. Since F is  $\alpha$ -closed in X,  $A \cap F$  is  $\alpha$ -closed in X.

**Theorem 4.8:** If A is a  $\psi^* \alpha$ -closed set in  $(X, \tau)$  and  $A \subseteq B \subseteq \alpha cl(A)$ . Then B is also a  $\psi^* \alpha$ -closed set in  $(X, \tau)$ .

**Proof:** Let U be a  $\psi g$ -open set of  $(X, \tau)$  such that  $B \subseteq U$ . Then  $A \subseteq U$ . Since A is a  $\psi^* \alpha$ -closed set,  $\alpha cl(A) \subseteq U$ . Also since  $B \subseteq \alpha cl(A)$ ,  $\alpha cl(B) \subseteq \alpha cl(\alpha cl(A)) = \alpha cl(A)$ . Hence  $\alpha cl(B) \subseteq U$ . Therefore B is also a  $\psi^* \alpha$ -closed set in  $(X, \tau)$ .

**Theorem 4.9:** Let A be a  $\psi^* \alpha$ -closed set of  $(X, \tau)$ . Then A is  $\alpha$ -closed if and only if  $\alpha cl(A)-A$  is  $\psi g$ -closed.

**Proof: (Necessity):** Let A be an  $\alpha$ -closed subset of  $(X, \tau)$ . Then  $\alpha cl(A) = A$  and therefore  $\alpha cl(A)-A = \phi$  which is  $\psi g$ -closed in  $(X, \tau)$ .

**Sufficiency:** Let  $\alpha cl(A)-A$  be a  $\psi g$ -closed set. Since A is  $\psi^* \alpha$ -closed by **theorem 4.5**,  $\alpha cl(A)-A$  contains no non-empty  $\psi g$ -closed set which implies  $\alpha cl(A)-A = \phi$ . That is  $\alpha cl(A) = A$ . Hence A is  $\alpha$ -closed.

**Definition 4.10:** Let  $(X, \tau)$  be a topological space and let  $B \subseteq A \subseteq X$ . Then  $B$  is  $\psi^* \alpha$ -closed relative to  $A$  if  $(\alpha \text{cl})_A(B) \subseteq U$ , whenever  $B \subseteq U$ ,  $U$  is  $\psi g$ -open in  $A$ .

**Theorem 4.11:** Let  $B \subseteq A \subseteq X$  and suppose that  $B$  is  $\psi^* \alpha$ -closed in  $(X, \tau)$ , then  $B$  is  $\psi^* \alpha$ -closed relative to  $A$ . The converse is true if  $A$  is  $\alpha$ -open and  $\psi^* \alpha$ -closed in  $(X, \tau)$ .

**Proof:** Suppose that  $B$  is a  $\psi^* \alpha$ -closed in  $(X, \tau)$ . Let  $B \subseteq U$ ,  $U$  is  $\psi g$ -open in  $A$ . Since  $U$  is  $\psi g$ -open set in  $A$ ,  $U = V \cap A$ , where  $V$  is  $\psi g$ -open in  $X$ . Hence  $B \subseteq U \subseteq V$ . Since  $B$  is  $\psi^* \alpha$ -closed in  $X$ ,  $\alpha \text{cl}(B) \subseteq V$ . Hence  $\alpha \text{cl}(B) \cap A \subseteq V \cap A$  which in turn implies that  $(\alpha \text{cl})_A(B) \subseteq V \cap A = U$ . Therefore  $B$  is  $\psi^* \alpha$ -closed relative to  $A$ .

Now, to prove the converse, assume that  $B \subseteq A \subseteq X$  where  $A$  is  $\alpha$ -open and  $\psi^* \alpha$ -closed in  $X$  and  $B$  is a  $\psi^* \alpha$ -closed relative to  $A$ . Let  $B \subseteq U$  and  $U$  be  $\psi g$ -open in  $X$ . Then  $A \cap U$  is  $\psi g$ -open in  $A$ . Since  $B \subseteq A$  and  $B \subseteq U$ ,  $B \subseteq A \cap U$ . Since  $B$  is a  $\psi^* \alpha$ -closed relative to  $A$ ,  $(\alpha \text{cl})_A(B) \subseteq A \cap U$ . Since  $A$  is  $\alpha$ -open, it is  $\psi g$ -open in  $X$ . Since  $A \subseteq A$  and  $A$  is  $\psi^* \alpha$ -closed in  $X$ ,  $\alpha \text{cl}(A) \subseteq A$ . Since  $B \subseteq A$ ,  $\alpha \text{cl}(B) \subseteq \alpha \text{cl}(A)$ . Hence  $\alpha \text{cl}(B) \subseteq A$ . Therefore  $\alpha \text{cl}(B) \cap A \subseteq \alpha \text{cl}(B)$  implies  $(\alpha \text{cl})_A(B) = \alpha \text{cl}(B)$ . Hence  $\alpha \text{cl}(B) \subseteq A \cap U = U$ . Thus  $B$  is  $\psi^* \alpha$ -closed in  $X$ .

**Theorem 4.12:** In a topological space  $(X, \tau)$ , for each  $x \in X$ , either  $\{x\}$  is  $\psi g$ -closed or  $X - \{x\}$  is  $\psi^* \alpha$ -closed set in  $(X, \tau)$ .

**Proof:** suppose that  $\{x\}$  is not  $\psi g$ -closed in  $X$ . Then  $X - \{x\}$  is not  $\psi g$ -open in  $X$ . Hence  $X$  is the only  $\psi g$ -open set containing  $X - \{x\}$ . That is  $(X - \{x\}) \subseteq X$ . Therefore  $\alpha \text{cl}(X - \{x\}) \subseteq X$  which implies that  $X - \{x\}$  is  $\psi^* \alpha$ -closed in  $(X, \tau)$ .

**Definition 4.13:** The intersection of all  $\psi g$ -open subsets of  $(X, \tau)$  containing  $A$  is called  $\psi g$ -kernel of  $A$  and is denoted by  $\psi g\text{-ker}(A)$   
i.e  $\psi g\text{-ker}(A) = \bigcap \{U / U \text{ is } \psi g\text{-open in } (X, \tau) \text{ and } A \subseteq U\}$

**Theorem 4.14:** A subset  $A$  of a topological space  $(X, \tau)$  is  $\psi^* \alpha$ -closed in  $(X, \tau)$  if and only if  $\alpha \text{cl}(A) \subseteq \psi g\text{-ker}(A)$ .

**Proof: (Necessity):** Suppose that  $A$  is  $\psi^* \alpha$ -closed set in  $(X, \tau)$  and  $x \in \alpha \text{cl}(A)$ . If  $x \notin \psi g\text{-ker}(A)$ , then there exists a  $\psi g$ -open set  $U$  in  $(X, \tau)$  such that  $A \subseteq U$  and  $x \notin U$ . Since  $U$  is  $\psi g$ -open set containing  $A$  and  $A$  is  $\psi^* \alpha$ -closed, we have  $\alpha \text{cl}(A) \subseteq U$ , which is a contradiction to  $x \in \alpha \text{cl}(A)$  and  $x \notin U$ .

**Sufficiency:** Suppose that  $\alpha \text{cl}(A) \subseteq \psi g\text{-ker}(A)$ . If  $U$  is any  $\psi g$ -open set containing  $A$ , then  $\psi g\text{-ker}(A) \subseteq U$  so we have  $\alpha \text{cl}(A) \subseteq U$ . Hence  $A$  is  $\psi^* \alpha$ -closed.

**Remark 4.15:** Jankovic and Reilly [11] stated that "If  $x$  is any point in a topological space  $(X, \tau)$ , then every singleton  $\{x\}$  is either nowhere dense or preopen in  $(X, \tau)$ ". Also this provides another decomposition namely  $X = X_1 \cup X_2$  where  $X_1 = \{x \in X : \{x\} \text{ is nowhere dense}\}$  and  $X_2 = \{x \in X : \{x\} \text{ is preopen}\}$ .

**Proposition 4.16:** For any subset  $A$  of a topological space  $(X, \tau)$ ,  $X_2 \cap \alpha \text{cl}(A) \subseteq \psi g\text{-ker}(A)$ .

**Proof:** Let  $x \in X_2 \cap \alpha \text{cl}(A)$  and if  $x \notin \psi g\text{-ker}(A)$ . Then there is a  $\psi g$ -open set  $U$  containing  $A$  such that  $x \notin U$ . Then  $U^c$  is  $\psi g$ -closed set containing  $x$ . Since  $x \in \alpha \text{cl}(A)$ ,  $\alpha \text{cl}(\{x\}) \subseteq \alpha \text{cl}(A)$ . Since  $x \in X_2$ ,  $\{x\} \subseteq \text{int}(\text{cl}(\{x\}))$ , hence  $\text{int}(\text{cl}(\{x\})) \neq \emptyset$ . Also  $x \in \alpha \text{cl}(A)$ , so  $A \cap \text{int}(\text{cl}(\{x\})) \neq \emptyset$ . Hence there is some point  $y \in A \cap \text{int}(\text{cl}(\{x\}))$  and therefore  $y \in A \cap U^c$ , which is a contradiction.

**Theorem 4.17:** A subset  $A$  of a topological space  $(X, \tau)$  is  $\psi^* \alpha$ -closed in  $(X, \tau)$  if and only if  $X_1 \cap \alpha \text{cl}(A) \subseteq A$

**Proof: (Necessity):** Suppose that  $A$  is  $\psi^* \alpha$ -closed in  $(X, \tau)$  and  $x \in X_1 \cap \alpha \text{cl}(A)$  but  $x \notin A$ . Since  $x \in X_1$ ,  $\text{int}(\text{cl}(\{x\})) = \emptyset$  so we have  $\text{int}(\text{cl}(\{x\})) = \emptyset \subseteq \{x\}$ . Therefore  $\{x\}$  is semi-closed. Since every semi-closed set is  $\psi g$ -closed,  $\{x\}$  is  $\psi g$ -closed and hence  $U = X - \{x\}$  is  $\psi g$ -open set containing  $A$  and so  $\alpha \text{cl}(A) \subseteq U$ . Since  $x \in \alpha \text{cl}(A)$  so we have  $x \in U$ , which is a contradiction.

**Sufficiency:** Suppose that  $X_1 \cap \alpha \text{cl}(A) \subseteq A$ . Since  $A \subseteq \psi g\text{-ker}(A)$ ,  $X_1 \cap \alpha \text{cl}(A) \subseteq \psi g\text{-ker}(A)$ . Therefore  $\alpha \text{cl}(A) = X \cap \alpha \text{cl}(A) = (X_1 \cup X_2) \cap \alpha \text{cl}(A) = (X_1 \cap \alpha \text{cl}(A)) \cup (X_2 \cap \alpha \text{cl}(A))$ . By hypothesis  $X_1 \cap \alpha \text{cl}(A) \subseteq \psi g\text{-ker}(A)$  and by

**Proposition 4.16:**  $X_2 \cap \alpha \text{cl}(A) \subseteq \psi g\text{-ker}(A)$ . Hence  $\alpha \text{cl}(A) \subseteq \psi g\text{-ker}(A)$ . Therefore by **Theorem 4.14**  $A$  is  $\psi^* \alpha$ -closed.

**Theorem 4.18:** Arbitrary intersection of  $\psi^* \alpha$ -closed sets in a topological space  $(X, \tau)$  is  $\psi^* \alpha$ -closed in  $(X, \tau)$ .

**Proof:** Let  $F = \{A_i : i \in \Lambda\}$  be a family of  $\psi^* \alpha$ -closed sets and  $A = \bigcap_{i \in \Lambda} A_i$ . Since  $A \subseteq A_i$  for each  $i \in \Lambda$ ,  $X_1 \cap \alpha \text{cl}(A) \subseteq X_1 \cap \alpha \text{cl}(A_i)$  for each  $i \in \Lambda$ , using **theorem 4.17** for each  $\psi^* \alpha$ -closed set  $A_i$ , we have  $X_1 \cap \alpha \text{cl}(A) \subseteq X_1 \cap \alpha \text{cl}(A_i) \subseteq A_i$  for each  $i \in \Lambda$ . Thus  $X_1 \cap \alpha \text{cl}(A) \subseteq \bigcap_{i \in \Lambda} A_i = A$ . That is  $X_1 \cap \alpha \text{cl}(A) \subseteq A$  and so by **theorem 4.17**  $A$  is  $\psi^* \alpha$ -closed in  $(X, \tau)$ .

**Remark 4.19:** Thus from **theorem 4.1** and **theorem 4.18** leads us into another class of closed sets namely  $\psi^* \alpha$ -closed sets which are closed under finite union and arbitrary intersection. Hence the class of  $\psi^* \alpha$ -closed sets form a topology.

**Lemma 4.20:** For a subset  $A$  of  $(X, \tau)$ ,  $\alpha \text{cl}(X-A) = X - \alpha \text{int}(A)$

**Theorem 4.21:** A subset  $A$  of a topological space  $(X, \tau)$  is  $\psi^* \alpha$ -open if and only if  $U \subseteq \alpha \text{int}(A)$  whenever  $U \subseteq A$  and  $U$  is  $\psi g$ -closed.

**Proof: (Necessity)** Assume that  $A$  is  $\psi^* \alpha$ -open. Then  $A^c$  is  $\psi^* \alpha$ -closed. Let  $U$  be a  $\psi g$ -closed set in  $(X, \tau)$  contained in  $A$ . Then  $U^c$  is a  $\psi g$ -open set in  $(X, \tau)$  containing  $A^c$ . Since  $A^c$  is  $\psi^* \alpha$ -closed,  $\alpha \text{cl}(A^c) \subseteq U^c$  equivalently  $U \subseteq \alpha \text{int}(A)$ .

**Sufficiency:** Assume that  $U$  is contained in  $\alpha \text{int}(A)$  whenever  $U$  is contained in  $A$  and  $U$  is  $\psi g$ -closed in  $(X, \tau)$ . Let  $A^c$  be contained in  $U$ , where  $U$  is  $\psi g$ -open. Then  $U^c$  is contained in  $A$ . By criteria,  $U^c \subseteq \alpha \text{int}(A)$ . This implies  $(\alpha \text{int}(A))^c \subseteq U$  that is  $\alpha \text{cl}(A^c) \subseteq U$ . Therefore  $A^c$  is  $\psi^* \alpha$ -closed. Hence  $A$  is  $\psi^* \alpha$ -open in  $(X, \tau)$ .

**Proposition 4.22:** If  $\alpha \text{int}(A) \subseteq B \subseteq A$  and  $A$  is  $\psi^* \alpha$ -open, then  $B$  is  $\psi^* \alpha$ -open.

**Proof:** Follows from lemma 4.20 and **Theorem 4.8**

**Theorem 4.23:** If  $A$  and  $B$  are  $\psi^* \alpha$ -open sets in  $(X, \tau)$ , then  $A \cap B$  is  $\psi^* \alpha$ -open in  $(X, \tau)$ .

**Proof:** Let  $A$  and  $B$  be  $\psi^* \alpha$ -open sets in  $(X, \tau)$ . Then  $X-A$  and  $X-B$  are  $\psi^* \alpha$ -closed sets and  $(X-A) \cup (X-B) = X - (A \cap B)$  is  $\psi^* \alpha$ -closed in  $(X, \tau)$ . Hence  $A \cap B$  is  $\psi^* \alpha$ -open.

**Theorem 4.24:** If a set  $A$  is  $\psi^* \alpha$ -open in  $(X, \tau)$  if and only if  $G=X$  whenever  $G$  is  $\psi g$ -open and  $\alpha \text{int}(A) \cup A^c \subseteq G$ .

**Proof: (Necessity):** Let  $A$  be  $\psi^* \alpha$ -open and  $G$  is  $\psi g$ -open and  $\alpha \text{int}(A) \cup A^c \subseteq G$ . This gives  $G^c \subseteq (\alpha \text{int}(A) \cup A^c)^c = (\alpha \text{int}(A))^c \cap A = (\alpha \text{int}(A))^c - A^c = \alpha \text{cl}(A^c) - A^c$ . Since  $A^c$  is  $\psi^* \alpha$ -closed and  $G^c$  is  $\psi g$ -closed by **theorem 4.5**, it follows that  $G^c = \emptyset$ . Therefore  $G=X$ .

**(Sufficiency):** Suppose that  $F$  is  $\psi g$ -closed and  $F \subseteq A$ . Then  $\alpha \text{int}(A) \cup A^c \subseteq \alpha \text{int}(A) \cup F^c$ . As open implies  $\alpha$ -open implies  $\psi g$ -open, we get  $\alpha \text{int}(A)$  is  $\psi g$ -open and  $F^c$   $\psi g$ -open. Hence  $\alpha \text{int}(A) \cup F^c$   $\psi g$ -open. It follows by the hypothesis that  $\alpha \text{int}(A) \cup F^c = X$  and hence  $F \subseteq \alpha \text{int}(A)$ . Therefore by **theorem 4.21**,  $A$  is  $\psi^* \alpha$ -open in  $(X, \tau)$ .

## 5. $\psi^* \alpha$ -CLOSURE

**Definition 5.1:** The  $\psi^* \alpha$ -closure of  $A$  (briefly  $\psi^* \alpha \text{cl}(A)$ ) of a topological space  $(X, \tau)$  is defined as follows.  
 $\psi^* \alpha \text{cl}(A) = \bigcap \{F \subseteq X : A \subseteq F \text{ and } F \text{ is } \psi^* \alpha\text{-closed in } (X, \tau)\}$

**Proposition 5.2:** For a subset  $A$  of a topological space  $(X, \tau)$ ,  $A \subseteq \psi^* \alpha \text{cl}(A) \subseteq \text{cl}(A)$

**Proof:** Follows from proposition 3.2

**Remark 5.3:** If  $A$  is  $\psi^* \alpha$ -closed in  $(X, \tau)$ , then  $\psi^* \alpha \text{cl}(A) = A$ .

**Theorem 5.4:** Let  $A$  be a subset of  $X$  and  $x \in X$ , then  $x \in \psi^* \alpha \text{cl}(A)$  if and only if for every  $\psi^* \alpha$ -open set  $U$  containing  $x$ ,  $U \cap A \neq \emptyset$ .

**Proof: (Necessity):** Let  $x \in \psi^* \alpha \text{cl}(A)$  and there exists a  $\psi^* \alpha$ -open set  $U$  containing  $x$  such that  $U \cap A = \emptyset$ . Since  $A \subseteq U^c$ ,  $\psi^* \alpha \text{cl}(A) \subseteq U^c$  and hence  $x \notin \psi^* \alpha \text{cl}(A)$ , which is a contradiction. Hence  $U \cap A \neq \emptyset$ .

**(Sufficiency):** Assume the given condition. Suppose that  $x \notin \psi^* \alpha \text{cl}(A)$ . Then there exists a  $\psi^* \alpha$ -closed set  $F$  containing  $A$  such that  $x \notin F$ . Then  $x \in F^c$  and  $F^c$  is  $\psi^* \alpha$ -open. By assumption,  $F^c \cap A \neq \emptyset$ . Since  $A \subseteq F$ ,  $F^c \cap A = \emptyset$ , which is a contradiction. Therefore  $x \in \psi^* \alpha \text{cl}(A)$ .

**Proposition 5.5:** Let A and B be any two subsets of  $(X, \tau)$ . Then the following statements are true

- (a)  $\psi^* \alpha \text{cl}(\phi) = \phi$  and  $\psi^* \alpha \text{cl}(X) = X$ .
- (b) If  $A \subseteq B$ , then  $\psi^* \alpha \text{cl}(A) \subseteq \psi^* \alpha \text{cl}(B)$ .
- (c)  $\psi^* \alpha \text{cl}(A) \cup \psi^* \alpha \text{cl}(B) = \psi^* \alpha \text{cl}(A \cup B)$
- (d)  $\psi^* \alpha \text{cl}(A \cap B) \subseteq \psi^* \alpha \text{cl}(A) \cap \psi^* \alpha \text{cl}(B)$
- (e)  $\psi^* \alpha \text{cl}(\psi^* \alpha \text{cl}(A)) = \psi^* \alpha \text{cl}(A)$ .

**Proof:** (a) and (b) follow from the definition of  $\psi^* \alpha$ -closure.

(c) Since  $A \subseteq A \cup B$  and  $B \subseteq A \cup B$ , by (b)  $\psi^* \alpha \text{cl}(A) \subseteq \psi^* \alpha \text{cl}(A \cup B)$  and  $\psi^* \alpha \text{cl}(B) \subseteq \psi^* \alpha \text{cl}(A \cup B)$ . Hence  $\psi^* \alpha \text{cl}(A) \cup \psi^* \alpha \text{cl}(B) \subseteq \psi^* \alpha \text{cl}(A \cup B)$ . To prove the reverse inclusion, let  $x \in \psi^* \alpha \text{cl}(A \cup B)$  and suppose that  $x \notin \psi^* \alpha \text{cl}(A) \cup \psi^* \alpha \text{cl}(B)$ . Then  $x \notin \psi^* \alpha \text{cl}(A)$  and  $x \notin \psi^* \alpha \text{cl}(B)$ . Therefore there exist a  $\psi^* \alpha$ -closed sets U and V in X such that  $A \subseteq U$ ,  $B \subseteq V$ ,  $x \notin U$  and  $x \notin V$ . Hence we have  $A \cup B \subseteq U \cup V$  and  $x \notin U \cup V$ . By **theorem 4.1**,  $U \cup V$  is a  $\psi^* \alpha$ -closed set and hence  $x \in \psi^* \alpha \text{cl}(A \cup B)$ , which is a contradiction. Hence  $\psi^* \alpha \text{cl}(A \cup B) \subseteq \psi^* \alpha \text{cl}(A) \cup \psi^* \alpha \text{cl}(B)$ . Therefore  $\psi^* \alpha \text{cl}(A) \cup \psi^* \alpha \text{cl}(B) = \psi^* \alpha \text{cl}(A \cup B)$ .

(d) Since  $A \cap B \subseteq A$  and  $A \cap B \subseteq B$ , by (b)  $\psi^* \alpha \text{cl}(A \cap B) \subseteq \psi^* \alpha \text{cl}(A)$  and  $\psi^* \alpha \text{cl}(A \cap B) \subseteq \psi^* \alpha \text{cl}(B)$ . Hence  $\psi^* \alpha \text{cl}(A \cap B) \subseteq \psi^* \alpha \text{cl}(A) \cap \psi^* \alpha \text{cl}(B)$ .

(e) Follows from the definition of  $\psi^* \alpha$ -closure.

**Remark 5.6:** The reverse inclusion of (d) is not true in general as seen from the following example.

**Example 5.7:** Let  $X = \{a, b, c, d\}$ ,  $\tau = \{\phi, \{a\}, \{a, b, c\}, X\}$ . If  $A = \{a\}$  and  $B = \{d\}$ , then  $\psi^* \alpha \text{cl}(A) = X$  and  $\psi^* \alpha \text{cl}(B) = \{d\}$ ,  $A \cap B = \phi$ ,  $\psi^* \alpha \text{cl}(A \cap B) = \phi$ . But  $\psi^* \alpha \text{cl}(A) \cap \psi^* \alpha \text{cl}(B) = \{d\}$ .

**Theorem 5.8:** The  $\psi^* \alpha$ -closure is a Kuratowski closure operator on  $(X, \tau)$ .

**Proof:** From  $\psi^* \alpha \text{cl}(\phi) = \phi$ ,  $A \subseteq \psi^* \alpha \text{cl}(A)$ ,  $\psi^* \alpha \text{cl}(A) \cup \psi^* \alpha \text{cl}(B) = \psi^* \alpha \text{cl}(A \cup B)$  and  $\psi^* \alpha \text{cl}(\psi^* \alpha \text{cl}(A)) = \psi^* \alpha \text{cl}(A)$  we can say that  $\psi^* \alpha$ -closure is a Kuratowski closure operator on  $(X, \tau)$ .
