### ABSTRACT

In this paper, we introduced and studied  $rgw\alpha$ -open sets in topological space and obtain some of their properties. Also we introduce  $rgw\alpha$ -interior,  $rgw\alpha$ -closure,  $rgw\alpha$ -neighbourhood and  $rgw\alpha$ -limit points in topological spaces.

**Keywords:**  $rgw\alpha$ -open sets,  $rgw\alpha$ -interior,  $rgw\alpha$ -closure,  $rgw\alpha$ -neighbourhood,  $rgw\alpha$ -limit points.

**Mathematics Subject Classification (2010):** 54A05.

---

### 1] INTRODUCTION

Regular open sets have been introduced and investigated by Stone [6]. P.Sundaram and M.Sheik John [8] defined and studied  $w$ -closed sets in topological spaces. S.S Benchalli and R.S.Wali [12] introduced and studied  $rw$ -closed sets. N.Jasted [7] introduced and studied  $\alpha$ -sets. S.S.Benchalli *et al.* [11] studied  $w\alpha$ -closed sets in topological spaces. S.S.Benchalli *et al.* [10] introduced  $g\alpha$ -closed sets. and P.G.Patil *et al.* [9] introduced  $g^*w\alpha$ -closed set. A. Vadivel and Vairamanickam [2] introduced  $rg\alpha$ -closed sets and  $rg\alpha$ -open sets in topological spaces. In this paper we define  $rgw\alpha$ -open sets, its properties and  $rgw\alpha$ -interior,  $rgw\alpha$ -closure,  $rgw\alpha$ -neighbourhood and  $rgw\alpha$ -limit points and obtain some of its basic properties.

### 2] PRELIMINARIES

Throughout the paper  $X$  and  $Y$  denote the topological space  $(X, \tau)$  and  $(Y, \sigma)$  respectively. And on which no separation axioms are assumed unless otherwise explicitly stated. For a subset  $A$  of space  $X$ ,  $cl(A)$ ,  $int(A)$ ,  $A^c$ , and  $rcl(A)$  denote the closure of  $A$ , Interior of  $A$ , complement of  $A$  and regular closure of  $A$  in  $X$  respectively.

**Definition 2.1:** A subset  $A$  of a space  $X$  is called

- 1) a regular open set [6] if  $A = int(cl(A))$  and a regular closed set if  $A = cl(int(A))$ .
- 2) a  $\alpha$ -open set [7] if  $A \subseteq int(cl(int(A)))$  and  $\alpha$ -closed set if  $cl(int(cl(A))) \subseteq A$ .
- 3) a weakly closed set (briefly,  $w$ -closed) [1] if  $cl(A) \subseteq U$  whenever  $A \subseteq U$  &  $U$  is semi open in  $X$ .
- 4) a weakly  $\alpha$ -closed set (briefly,  $w\alpha$ -closed) [11] if  $\alpha cl(A) \subseteq U$  whenever  $A \subseteq U$  &  $U$  is  $w$ -open in  $X$ .
- 5) a regular  $\alpha$ -open set (2) if there is a regular open set  $U \ni U \subseteq A \subseteq \alpha cl(U)$

The intersection of all regular closed (resp.  $\alpha$ -closed,  $w\alpha$ -closed and regular  $\alpha$ -closed) subsets of space  $X$  containing  $A$  is called regular closure (Resp.  $\alpha$ -closure,  $w\alpha$ -closure and regular  $\alpha$ -closure) of  $A$  and denoted by  $rcl(A)$  (resp.  $\alpha cl(A)$ ,  $w\alpha cl(A)$  and  $racl(A)$ ).

**Definition 2.2:** A subset  $A$  of a space  $X$  is called

- 1) generalized  $\alpha$ -closed set (briefly  $g\alpha$ -closed) [4], if  $\text{acl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\alpha$ -open in  $X$ .
- 2) generalized semi-pre closed set (briefly  $gsp$ -closed) [5] if  $\text{spcl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $X$ .
- 3) generalized weak  $\alpha$ -closed (briefly  $gwa$ -closed) set [10] if  $\text{acl}(A) \subseteq U$  whenever  $A \subseteq U$  &  $U$  is  $w\alpha$ -open in  $X$ .
- 4) generalized star weakly  $\alpha$ -closed set (briefly  $g^*w\alpha$ -closed) [9] if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  &  $U$  is  $w\alpha$ -open in  $X$ .
- 5) regular generalized  $\alpha$ -closed set (briefly  $rg\alpha$ -closed) [2] if  $\text{acl}(A) \subseteq U$  whenever  $A \subseteq U$  &  $U$  is regular  $\alpha$ -open in  $X$ .

The complements of the above mentioned closed sets are respective open sets.

### 3. $rgw\alpha$ -closed sets in topological spaces.

**Definition 3.1 [13]:** A subset  $A$  of a space  $X$  is called regular generalized weakly  $\alpha$ -closed set (briefly  $rgw\alpha$ -closed) if  $\text{r}\alpha\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  &  $U$  is weak  $\alpha$ -open set in  $X$ .

**Results 3.2** from [13]:

- 1) Every closed set is  $rgw\alpha$ -closed set in  $X$ .
- 2) Every regular closed set is  $rgw\alpha$ -closed set in  $X$ .
- 3) Every weak- closed set is  $rgw\alpha$ -closed set in  $X$ .
- 4) Every  $\alpha$ -closed,  $g\alpha$ -closed,  $rg\alpha$ -closed,  $gwa$ -closed and  $g^*w\alpha$ -closed sets are  $rgw\alpha$ -closed sets in  $X$ .
- 5) Every  $rw$ -closed,  $r\alpha$ -closed,  $rs$ -closed and  $w\alpha$ -closed sets are  $rgw\alpha$ -closed sets in  $X$ .
- 6) Every  $rgw\alpha$ -closed set is  $g\beta$ -closed set in  $X$ .
- 7) The union of two  $rgw\alpha$ -closed sets of  $X$  is  $rgw\alpha$ -closed set in  $X$ .
- 8) The intersection of two  $rgw\alpha$ -closed sets of  $X$  is need not be  $rgw\alpha$ -closed set.

### 4. $rgw\alpha$ -open sets and their basic properties

In this section we introduce and study  $rgw\alpha$ -open sets in topological spaces and obtain some of their properties.

**Definition 4.1:** A subset  $A$  of  $X$  is called regular generalized weakly- $\alpha$  open set ( $rgw\alpha$ -open set) in  $X$  if  $A^c$  is  $rgw\alpha$ -closed in  $X$ . We denote the family of all  $rgw\alpha$ -open sets in  $X$  by  $RGW\alpha O(X)$ .

**Theorem 4.2:** If a subset  $A$  of a space  $X$  is  $w$ -open then it is  $rgw\alpha$ -open set, but not conversely.

**Proof:** Let  $A$  be a  $w$ -open set in a space  $X$ . Then  $A^c$  is  $w$ -closed set. By result 3.2(3)  $A^c$  is  $rgw\alpha$ -closed. Therefore  $A$  is  $rgw\alpha$ -open set in  $X$ . The converse of this theorem need not be true as seen from the following example.

**Example 4.3:** Let  $X = \{a, b, c, d, e\}$  with topology  $\tau = \{X, \phi, \{a\}, \{d\}, \{e\}, \{a, d\}, \{a, e\}, \{d, e\}, \{a, d, e\}\}$ . Then the set  $A = \{c\}$  is  $rgw\alpha$ -open set but not  $w$ -open set in  $X$ .

**Corollary 4.4:** Every open set is  $rgw\alpha$ -open set but not conversely.

**Proof:** Follows from definition and theorem 4.2.

**Corollary 4.5:** Every regular open set is  $rgw\alpha$ -open set but not conversely.

**Proof:** Follows from definition and theorem 4.2.

**Theorem 4.6:** If a subset  $A$  of a space  $X$  is  $rgw\alpha$ -open, then it is  $g\beta$ -open set in  $X$ .

**Proof:** Let  $A$  be  $rgw\alpha$ -open set in  $X$ . Then  $A^c$  is  $rgw\alpha$ -closed set in  $X$ . By result 3.2(6)  $A^c$  is  $g\beta$ -closed set in  $X$ . Therefore  $A$  is  $g\beta$ -open set in space  $X$ . The converse of this theorem need not be true as seen from the following example.

**Example 4.7:** In example 4.3 the subset  $\{b, c\}$  of  $X$  is  $g\beta$ -open set but not  $rgw\alpha$ -open set.

**Theorem 4.8:** If a subset  $A$  of  $X$  is  $g\alpha$ -open set then it is  $rgw\alpha$ -open set in  $X$ , but not conversely.

**Proof:** Let  $A$  be a  $g\alpha$ -open set in a space  $X$ . Then  $A^c$  is  $g\alpha$ -closed set. By result 3.2(4)  $A^c$  is  $rgw\alpha$ -closed. Therefore  $A$  is  $rgw\alpha$ -open set in  $X$ . The converse of this theorem need not be true as seen from the following example.

**Example 4.9:** In example 4.3 the subset  $A=\{a, b\}$  of  $X$  is  $rgw\alpha$ -open set but not  $g\alpha$ -open set in  $X$ .

**Theorem 4.10:** If a subset  $A$  of  $X$  is  $gwa$ -open set then it is  $rgw\alpha$ -open set in  $X$ , but not conversely.

**Proof:** Let  $A$  be a  $gwa$ -open set in a space  $X$ . Then  $A^c$  is  $gwa$ -closed set. By result 3.2 (4)  $A^c$  is  $rgw\alpha$ -closed. Therefore  $A$  is  $rgw\alpha$ -open set in  $X$ . The converse of this theorem need not be true as seen from the following example.

**Example 4.11:** In example 4.3 the sub set  $A= \{b\}$  of  $X$  is  $rgw\alpha$ -open set but not  $gwa$ -open set in  $X$ .

**Corollary 4.12:** If a subset  $A$  of  $X$  is  $g^*wa$ -open set then it is  $rgw\alpha$ -open set in  $X$ , but not conversely.

**Proof:** it follows from the theorem 4.10 and the implication  $gwa \Rightarrow g^*wa$  set.

**Theorem 4.13:** If  $A$  and  $B$  are  $rgw\alpha$ -open sets in a space  $X$ . Then  $A \cap B$  is also  $rgw\alpha$ -open set in  $X$ .

**Proof:** If  $A$  and  $B$  are  $rgw\alpha$ -open sets in a space  $X$ . Then  $A^c$  and  $B^c$  are  $rgw\alpha$ -closed sets in a space  $X$ . By result 3.2(7).  $A^c \cup B^c$  is also  $rgw\alpha$ -closed set in  $X$ . That is  $A^c \cup B^c = (A \cap B)^c$  is a  $rgw\alpha$ -closed set in  $X$ . Therefore  $A \cap B$  is  $rgw\alpha$ -open set in  $X$ .

**Remark 4.14:** The union of two  $rgw\alpha$ -open sets in  $X$  is generally not a  $rgw\alpha$ -open in  $X$ .

**Example 4.15:** In example 4.3 the sets  $A=\{a,b\}$  and  $B=\{c\}$  are  $rgw\alpha$ -open sets in  $X$ , But  $A \cup B=\{a,b,c\}$  is not  $rgw\alpha$ -open set in  $X$ .

**Theorem 4.16:** If a set  $A$  is  $rgw\alpha$ -open in a space  $X$ , then  $G=X$ , whenever  $G$  is  $wa$ -open and  $\text{int}(A) \cup A^c \subset G$ .

**Proof:** Suppose that  $A$  is  $rgw\alpha$ -open in  $X$ . Let  $G$  be weak  $\alpha$ -open and  $\text{int}(A) \cup A^c \subset G$ . This implies  $G^c \subset (\text{int}(A) \cup A^c)^c = (\text{int}(A))^c \cap A$ . That is  $G^c \subset (\text{int}(A))^c - A^c$ . Thus  $G^c \subset \text{cl}(A)^c - A^c$ , since  $(\text{int}(A))^c = \text{cl}(A^c)$ . Now  $G^c$  is also weak  $\alpha$ -open and  $A^c$  is  $rgw\alpha$ -closed then by theorem it follows that  $G^c = \emptyset$ . Hence  $G=X$ . The converse of this theorem need not be true as seen from the following example.

**Example 4.17:** In Example 4.3  $RGW\alpha O(X) = \{X, \phi, \{a\}, \{b\}, \{c\}, \{d\}, \{e\}, \{a, b\}, \{a, c\}, \{a, d\}, \{a, e\}, \{b, d\}, \{d, e\}, \{c, d\}, \{c, e\}, \{a, b, d\}, \{a, b, e\}, \{a, c, d\}, \{a, c, e\}, \{a, d, e\}, \{b, c, d\}, \{b, d, e\}, \{c, d, e\}, \{a, b, c, d\}, \{a, b, d, e\}, \{a, b, c, e\}, \{a, c, d, e\}, \{b, c, d, e\}\}$ . And  $WaO(X) = \{X, \phi, \{a\}, \{b\}, \{d\}, \{e\}, \{b, d\}, \{a, d\}, \{a, b\}, \{a, c\}, \{a, e\}, \{b, e\}, \{d, e\}, \{a, b, c\}, \{a, b, d\}, \{a, b, e\}, \{b, d, e\}, \{a, d, e\}, \{a, b, d, e\}, \{a, c, d, e\}\}$ . Take  $A = \{a, c, d\}$ . then  $A$  is not  $rgw\alpha$ -open. However  $\text{int}(A) \cup A^c = \{a, d\} \cup \{b, e\} = \{a, b, d, e\}$ . so for some weak  $\alpha$ -open  $G$ , we have  $\text{int}(A) \cup A^c = \{a, b, d, e\} \subset G$  gives  $G=X$ , but  $A$  is not  $rgw\alpha$ -open.

**Theorem 4.18:** A subset  $A$  of  $(X, \tau)$  is  $rgw\alpha$ -open set if and only if  $U \subseteq r\alpha \text{int}(A)$  whenever  $U$  is  $wa$ -closed and  $U \subseteq A$ .

**Proof:** Assume that  $A$  is  $rgw\alpha$ -open in  $X$  and  $U$  is  $wa$ -closed set of  $(X, \tau)$  such that  $U \subseteq A$ . Then  $X-A$  is  $rgw\alpha$ -closed set in  $(X, \tau)$ . Also  $X-A \subseteq X-U$  and  $X-U$  is  $wa$ -open set of  $(X, \tau)$ . This implies that  $r\alpha \text{cl}(X-A) \subseteq X-U$ . But  $r\alpha \text{cl}(X-A) = X - r\alpha \text{int}(A)$ . Thus  $X - r\alpha \text{int}(A) \subseteq X-U$ . So  $U \subseteq r\alpha \text{int}(A)$ .

Conversely, Suppose  $U \subseteq r\text{aint}(A)$  whenever  $U$  is  $w\alpha$ -closed and  $U \subseteq A$ , To prove that  $A$  is  $rgw\alpha$ -open in  $X$ . Let  $G$  be  $w\alpha$ -open set of  $(X, \tau)$  s.t.  $X-A \subseteq G$ . Then  $X-G \subseteq A$ . Now  $X-G$  is  $w\alpha$ -closed set containing  $A$ . So  $X-G \subseteq r\text{aint}(A)$ ,  $X-r\text{aint}(A) \subseteq G$ , But  $r\text{acl}(X-A) = X - r\text{aint}(A)$ . Thus  $r\text{acl}(X-A) \subseteq G$ . i.e  $X-A$  is  $rgw\alpha$ -closed set. Hence  $A$  is  $rgw\alpha$ -open set.

**Theorem 4.19:** If  $A$  is  $w\alpha$ -open and  $rgw\alpha$ -closed set then  $A$  is  $r\alpha$ -closed.

**Proof:** Since  $A \subseteq A$  and  $A$  is  $w\alpha$ -open and  $rgw\alpha$ -closed we have  $r\text{acl}(A) \subseteq A$ . Thus  $r\text{acl}(A) = A$ . Hence  $A$  is  $r\alpha$ -closed set of  $(X, \tau)$ .

**Theorem 4.20:** If  $r\text{aint}(A) \subseteq B \subseteq A$  and  $A$  is  $rgw\alpha$ -open set in  $X$ , then  $B$  is  $rgw\alpha$ -open set in  $X$ .

**Proof:** If  $r\text{aint}(A) \subseteq B \subseteq A$ , then  $X-A \subseteq X-B \subseteq X-r\text{aint}(A) = r\text{acl}(X-A)$ . Since  $(X-A)$  is  $rgw\alpha$ -closed set, then by theorem 3.15 [13]  $X-B$  is also  $rgw\alpha$ -closed set in  $X$ . Therefore  $B$  is  $rgw\alpha$ -open set in  $X$ .

**Theorem 4.21:** If  $A$  is  $rgw\alpha$ -closed set in  $X$ , then  $r\text{acl}(A)-A$  is  $rgw\alpha$ -open set in  $X$ .

**Proof:** Let  $A$  be  $rgw\alpha$ -closed set in  $X$ , Let  $F$  be an  $w\alpha$ -open s.t.  $F \subseteq r\text{acl}(A)-A$ . Since  $A$  is  $rgw\alpha$ -closed, then by theorem 3.12[13]  $r\text{acl}(A)-A$  does not contain any non empty  $w\alpha$ -closed set in  $X$ . Thus  $F = \emptyset$ . Then  $F \subseteq r\text{aint}(r\text{acl}(A)-A)$ . Therefore by theorem 4.18  $r\text{acl}(A)-A$  is  $rgw\alpha$ -open set in  $X$ .

**Theorem 4.22:** If  $A$  and  $B$  be subsets of space  $(X, \tau)$ . If  $B$   $rgw\alpha$ -open and  $r\text{aint}(B) \subseteq A$ , then  $A\alpha B$  is  $rgw\alpha$ -open set in  $X$ .

**Proof:** Let  $B$  is  $rgw\alpha$ -open in  $X$ .  $r\text{aint}(B) \subseteq A$  and  $r\text{aint}(B) \subseteq B$  is always true, then  $r\text{aint}(B) \subseteq A\alpha B$ . also  $r\text{aint}(B) \subseteq A\alpha B \subseteq B$  and  $B$  is  $rgw\alpha$ -open set then by theorem 4.20  $A\alpha B$  is also  $rgw\alpha$ -open set in  $X$ .

## 5. $rgw\alpha$ -Closure and $rgw\alpha$ -Interior

In this section the notation of  $rgw\alpha$ -Closure and  $rgw\alpha$ -Interior is defined and some of its basic properties are studied.

**Definition 5.1:** For a subset  $A$  of  $X$ ,  $rgw\alpha$ -Closure of  $A$  is denoted by  $rgw\text{acl}(A)$  and defined as  $rgw\text{acl}(A) = \bigcap \{G: A \subseteq G, G \text{ is } rgw\alpha\text{-closed in } X\}$  or  $\bigcap \{G: A \subseteq G, G \in RGW\alpha C(X)\}$ .

**Theorem 5.2:** If  $A$  and  $B$  are subsets of a space  $X$  then

- i)  $rgw\text{acl}(X) = X$ ,  $rgw\text{acl}(\emptyset) = \emptyset$ .
- ii)  $A \subseteq rgw\text{acl}(A)$ .
- iii) If  $B$  is any  $rgw\alpha$ -closed set containing  $A$ , then  $rgw\text{acl}(A) \subseteq B$ .
- iv) If  $A \subseteq B$  then  $rgw\text{acl}(A) \subseteq rgw\text{acl}(B)$ .
- v)  $rgw\text{acl}(A) = rgw\text{acl}(rgw\text{acl}(A))$ .
- vi)  $rgw\text{acl}(A \cup B) = rgw\text{acl}(A) \cup rgw\text{acl}(B)$ .

**Proof:** i) By definition of  $rgw\alpha$ -Closure,  $X$  is Only  $rgw\alpha$ -closed set containing  $X$ , therefore  $rgw\text{acl}(X) = \text{Intersection of all the } rgw\alpha\text{-closed set containing } X = \bigcap \{X\} = X$ , therefore  $rgw\text{acl}(X) = X$ . Again By the Definition of  $rgw\alpha$ -Closure  $rgw\text{acl}(\emptyset) = \text{Intersection of all } rgw\alpha\text{-closed set containing } \emptyset = \emptyset \cap \text{any } rgw\alpha\text{-closed set containing } \emptyset = \emptyset$ . Therefore  $rgw\text{acl}(\emptyset) = \emptyset$ .

ii) By definition of  $rgw\alpha$ -Closure of  $A$  it is obvious that  $A \subseteq rgw\text{acl}(A)$ .

iii) Let B be any  $rgw\alpha$ -closed set containing A, Since  $rgw\alpha cl(A)$  is the intersection of all  $rgw\alpha$ -closed set containing A,  $rgw\alpha cl(A)$  is contained in every  $rgw\alpha$ -closed set containing A. Hence in particular  $rgw\alpha cl(A) \subseteq B$ .

iv) Let A and B be subsets of X, such that  $A \subseteq B$  by definition of  $rgw\alpha$ -Closure,  $rgw\alpha cl(B) = \bigcap \{F: B \subseteq F \in RGW\alpha C(X)\}$ . If  $B \subseteq F \in RGW\alpha C(X)$ , then  $rgw\alpha cl(B) \subseteq F$ . Since  $A \subseteq B$ ,  $A \subseteq B \subseteq F \in RGW\alpha C(X)$ , we have  $rgw\alpha cl(A) \subseteq F$ ,  $rgw\alpha cl(A) \subseteq \bigcap \{F: B \subseteq F \in RGW\alpha C(X)\} = rgw\alpha cl(B)$ . Therefore  $rgw\alpha cl(A) \subseteq rgw\alpha cl(B)$ .

v) Let A be any subset of X by definition of  $rgw\alpha$ -Closure,  $rgw\alpha cl(A) = \bigcap \{F: A \subseteq F \in RGW\alpha C(X)\}$ . Therefore  $A \subseteq F \in RGW\alpha C(X)$  then  $rgw\alpha cl(A) \subseteq F$ , Since F is  $rgw\alpha$ -closed set containing  $rgw\alpha cl(A)$  by (iii)  $rgw\alpha cl(rgw\alpha cl(A)) = \bigcap \{F: A \subseteq F \in RGW\alpha C(X)\} = rgw\alpha cl(A)$ . therefore  $rgw\alpha cl(rgw\alpha cl(A)) = rgw\alpha cl(A)$

vi) Let A and B be subsets of X, clearly  $A \subseteq A \cup B$ ,  $B \subseteq A \cup B$  from (iv)  $rgw\alpha cl(A) \subseteq rgw\alpha cl(A \cup B)$ ,  $rgw\alpha cl(B) \subseteq rgw\alpha cl(A \cup B)$ . Hence  $rgw\alpha cl(A) \cup rgw\alpha cl(B) \subseteq rgw\alpha cl(A \cup B)$ . Now we have to prove  $rgw\alpha cl(A \cup B) \subseteq rgw\alpha cl(A) \cup rgw\alpha cl(B)$ .

Suppose  $x \notin rgw\alpha cl(A) \cup rgw\alpha cl(B)$  then  $\exists$   $rgw\alpha$ -closed set  $A_1$  and  $B_1$  with  $A \subseteq A_1$ ,  $B \subseteq B_1$  &  $x \notin A_1 \cup B_1$ . We have  $A \cup B \subseteq A_1 \cup B_1$  and  $A_1 \cup B_1$  is the  $rgw\alpha$ -closed set such that  $x \notin A_1 \cup B_1$ . Thus  $x \notin rgw\alpha cl(A \cup B)$  hence  $rgw\alpha cl(A \cup B) \subseteq rgw\alpha cl(A) \cup rgw\alpha cl(B)$  (2). From (1) and (2) we have  $rgw\alpha cl(A \cup B) = rgw\alpha cl(A) \cup rgw\alpha cl(B)$ .

**Theorem 5.3:** If  $A \subseteq X$  is  $rgw\alpha$ -closed set then  $rgw\alpha cl(A) = A$ .

**Proof:** Let A be  $rgw\alpha$ -closed subset of X. We know that  $A \subseteq rgw\alpha cl(A)$  - (1). Also  $A \subseteq A$  and A is  $rgw\alpha$ -closed set by theorem 5.2 (iii)  $rgw\alpha cl(A) \subseteq A$  - (2). Hence  $rgw\alpha cl(A) = A$ .

The converse of the above need not be true as seen from the following example.

**Example 5.4:** Let  $X = \{a, b, c, d, e\}$  with topology  $\tau = \{X, \phi, \{a\}, \{d\}, \{e\}, \{a, d\}, \{a, e\}, \{d, e\}, \{a, d, e\}\}$  here  $A = \{a, d\}$  and  $rgw\alpha cl(A) = \{a, d\} = A$  but A is not  $rgw\alpha$ -closed set.

**Theorem 5.5:** If A and B are subsets of Space X then  $rgw\alpha cl(A \cap B) \subseteq rgw\alpha cl(A) \cap rgw\alpha cl(B)$ .

**Proof:** Let A and B be subsets of X, clearly  $A \cap B \subseteq A$ ,  $A \cap B \subseteq B$ , by theorem 5.2 (iv)  $rgw\alpha cl(A \cap B) \subseteq rgw\alpha cl(A)$ ,  $rgw\alpha cl(A \cap B) \subseteq rgw\alpha cl(B)$ , hence  $rgw\alpha cl(A \cap B) \subseteq rgw\alpha cl(A) \cap rgw\alpha cl(B)$ .

**Remark 5.6:** In general  $rgw\alpha cl(A) \cap rgw\alpha cl(B) \not\subseteq rgw\alpha cl(A \cap B)$ .

**Theorem 5.7:** For an  $x \in X$ ,  $x \in rgw\alpha cl(X)$  if and only if  $A \cap V \neq \phi$  for every  $rgw\alpha$ -open set V containing x.

**Proof:** Let  $x \in rgw\alpha cl(A)$ . To prove  $A \cap V \neq \phi$  for every  $rgw\alpha$ -open set V containing x by contradiction. Suppose  $\exists$   $rgw\alpha$ -open set V containing x s.t.  $A \cap V = \phi$  then  $A \subseteq X - V$ ,  $X - V$  is  $rgw\alpha$ -closed set,  $rgw\alpha cl(A) \subseteq X - V$ . This Shows that  $x \notin rgw\alpha cl(A)$  which is contradiction. Hence  $A \cap V \neq \phi$  for every  $rgw\alpha$ -open set V containing x.

Conversely: Let  $A \cap V \neq \phi$  for every  $rgw\alpha$ -open set V containing x. To prove  $x \in rgw\alpha cl(A)$ . We prove the result by contradiction. Suppose  $x \notin rgw\alpha cl(A)$  then there exist a  $rgw\alpha$ -closed subset F containing A s.t.  $x \notin F$ . Then  $x \in X - F$  is  $rgw\alpha$ -open. Also,  $(X - F) \cap A = \phi$  which is contradiction. Hence  $x \in rgw\alpha cl(A)$ .

**Theorem 5.8:** If A is subset of space X, then

- i)  $rgw\alpha cl(A) \subseteq cl(A)$
- ii)  $rgw\alpha cl(A) \subseteq r\alpha cl(A)$

**Proof:** Let A be subset of space X by definition of closure  $cl(A) = \bigcap \{F : A \subseteq F \in C(X)\}$  If  $A \subseteq F \in C(X)$  then  $A \subseteq F \in RGW\alpha C(X)$  because every closed set is  $rgw\alpha$ -closed that is  $rgw\alpha cl(A) \subseteq F$ , therefore  $rgw\alpha cl(A) \subseteq \bigcap \{F : A \subseteq F \in C(X)\}$  Hence  $rgw\alpha cl(A) \subseteq cl(A)$ .

ii) let A be subset of space X by definition of  $ra$ -closure  $racl(A) = \bigcap \{F : A \subseteq F \in raC(x)\}$ , If  $A \subseteq F \in raC(x)$  then  $A \subseteq F \in rgw\alpha C(x)$  because every  $ra$ -closed set is  $rgw\alpha$ -closed that is  $rgw\alpha cl(A) \subseteq F$  therefore  $rgw\alpha cl(A) \subseteq \bigcap \{F : A \subseteq F \in raC(x)\} = racl(A)$ . Hence  $rgw\alpha cl(A) \subseteq racl(A)$ .

**Remark 5.9:** Containment relation in the above theorem 5.8 may be proper as seen from following example.

**Example 5.10:** Let  $X = \{a, b, c, d, e\}$  with topology  $\tau = \{X, \phi, \{a\}, \{d\}, \{e\}, \{a, d\}, \{a, e\}, \{d, e\}, \{a, d, e\}$ ,  $A = \{a, b, d, e\}$ ,  $cl(A) = \{X\}$ ,  $rgw\alpha cl(A) = \{a, b, d, e\}$  &  $racl(A) = \{X\}$ . It follows that  $rgw\alpha cl(A) \subset Cl(A)$  and  $rgw\alpha cl(A) \subset racl(A)$ .

**Theorem 5.11:** If A is subset of space X then  $gspcl(A) \subseteq rgw\alpha cl(A)$  where  $gspcl(A) = \bigcap \{F : A \subseteq F \in GSPC(X)\}$ .

**Proof:** Let A be subset of X by definition of  $rgw\alpha$ -closure  $rgw\alpha cl(A) = \bigcap \{F : A \subseteq F \in RGW\alpha C(X)\}$ . If  $A \subseteq F \in RGW\alpha C(X)$  then  $A \subseteq F \in GSPC(X)$ , because every  $rgw\alpha$ -closed is  $gsp$ -closed i.e.  $gspcl(A) \subseteq F$ . therefore  $gspcl(A) \subseteq \bigcap \{F : A \subseteq F \in RGW\alpha C(X)\} = rgw\alpha cl(A)$ .

Hence  $gspcl(A) \subseteq rgw\alpha cl(A)$ .

**Theorem 5.12:**  $rgw\alpha$ -Closure is a kuratowski-Closure operator on a space X.

**Proof:** Let A and B be the subsets of space X. i)  $rgw\alpha cl(x) = x$ ,  $rgw\alpha cl(\phi) = \phi$  ii)  $A \subseteq rgw\alpha cl(A)$  iii)  $rgw\alpha cl(A) = rgw\alpha cl(rgw\alpha cl(A))$  iv)  $rgw\alpha cl(A \cup B) = rgw\alpha cl(A) \cup rgw\alpha cl(B)$  by theorem 5.2 Hence,  $rgw\alpha$ -Closure is a Kuratowski-Closure operator on a space X.

**Definition 5.13:** For a subset A of X,  $rgw\alpha$ -Interior of A is denoted by  $rgw\alpha int(A)$  and defined as  $rgw\alpha int(A) = \bigcup \{G : G \subseteq A \text{ and } G \text{ is } rgw\alpha\text{-open in } X\}$  or  $\bigcup \{G : G \subseteq A \text{ and } G \in RGW\alpha O(X)\}$ .

i.e.  $rgw\alpha\text{-int}(A)$  is the union of all  $rgw\alpha$ -open set contained in A.

**Theorem 5.14:** Let A and B be subset of space x then

- i)  $rgw\alpha int(X) = X$ ,  $rgw\alpha int(\phi) = \phi$
- ii)  $rgw\alpha int(A) \subseteq A$
- iii) If B is any  $rgw\alpha$ -open set contained in A then  $B \subseteq rgw\alpha int(A)$
- iv) If  $A \subseteq B$  then  $rgw\alpha int(A) \subseteq rgw\alpha int(B)$
- v)  $rgw\alpha int(A) = rgw\alpha int(rgw\alpha int(A))$ .
- vi)  $rgw\alpha int(A \cap B) = rgw\alpha int(A) \cap rgw\alpha int(B)$

**Proof:** i) and ii) by definition of  $rgw\alpha$ -Interior of A, it is obvious.

iii) Let B be any  $rgw\alpha$ -open set such that  $B \subseteq A$ . Let  $x \in B$ , B is an  $rgw\alpha$ -open set contained in A, x is an element of  $rgw\alpha$ -Interior of A i.e.  $x \in rgw\alpha int(A)$ . Hence  $B \subseteq rgw\alpha int(A)$ .

iv), v) vi) similar proof as theorem 5.2 and definition of  $rgw\alpha$ -Interior.

**Theorem 5.15:** If a subset A of X is  $rgw\alpha$ -open then  $rgw\alpha int(A) = A$ .

**Proof:** Let A be  $rgw\alpha$ -open subset of X. We know that  $rgw\alpha int(A) \subseteq A$  –(1) Also A is  $rgw\alpha$ -open set contained in A from theorem 5.13 iii)  $A \subseteq rgw\alpha int(A)$  –(2) hence from (1) and (2)  $rgw\alpha int(A) = A$ .

**Theorem 5.16:** If A and B are subsets of space X then  $rgwaint(A) \cup rgwaint(B) \subseteq rgwaint(A \cup B)$

**Proof:** We know that  $A \subseteq (A \cup B)$  and  $B \subseteq (A \cup B)$  we have theorem 5.13 iv)  $rgwaint(A) \subseteq rgwaint(A \cup B)$  and  $rgwaint(B) \subseteq rgwaint(A \cup B)$ . This implies that  $rgwaint(A) \cup rgwaint(B) \subseteq rgwaint(A \cup B)$ .

**Remarks 5.17:** The converse of the above theorem need not be true.

**Theorem 5.18:** If A is a subset of X then i)  $int(A) \subseteq rgwaint(A)$  ii)  $raint(A) \subseteq rgwaint(A)$ .

**Proof:** Let A be a subset of a space X. Let  $x \in int(A) \Rightarrow x \in \bigcup \{G : G \text{ is open, } G \subseteq A\}$

$\Rightarrow \exists$  an open set G s.t.  $x \in G \subseteq A \Rightarrow \exists$  an  $rgw\alpha$ -open set G s.t.  $x \in G \subseteq A$  as every open set is  $rgw\alpha$ -open set in X  $\Rightarrow x \in \bigcup \{G : G \text{ is } rgw\alpha\text{-open set in X}\} \Rightarrow x \in rgwaint(A)$ , thus  $x \in int(A) \Rightarrow x \in rgwaint(A)$ , Hence,  $int(A) \subseteq rgwaint(A)$ .

ii) Let A be a subset of space X. Let  $x \in raint(A)$ ,  $\Rightarrow x \in \bigcup \{G : G \text{ is } r\alpha\text{-open } G \subseteq A\}$

$\Rightarrow \exists$  an  $r\alpha$ -open set G s.t.  $x \in G \subseteq A$

$\Rightarrow \exists$  an  $rgw\alpha$ -open set G s.t.  $x \in G \subseteq A$ , as every  $r\alpha$ -open set is an  $rgw\alpha$ -open set in X  $\Rightarrow x \in \bigcup \{G : G \text{ is } rgw\alpha\text{-open set in X}\} \Rightarrow x \in rgwaint(A)$ .

Thus  $x \in raint(A) \Rightarrow x \in rgwaint(A)$ .

Hence  $raint(A) \subseteq rgwaint(A)$ .

**Remark 5.19:** Containment relation in the above theorem may be proper as seen from the following example.

**Example 5.20:** Let  $X = \{a, b, c, d, e\}$  with topology  $\tau = \{\emptyset, \{a\}, \{d\}, \{e\}, \{a, d\}, \{a, e\}, \{a, d, e\}\}$   $A = \{a, b\}$   
 $int(A) = \{a\}$ ,  $raint(A) = \{a\}$ ,  $rgwaint(A) = \{a, b\}$  therefore  $int(A) \subset rgwaint(A)$  and  $raint(A) \subset rgwaint(A)$

**Theorem 5.21:** If A is subset of X, then  $rgwaint(A) \subseteq gspint(A)$ , where  $gspint(A)$  is given by  $gspint(A) = \bigcup \{G \subseteq X : G \text{ is } gsp\text{-open, } G \subseteq A\}$ .

**Proof:** Let A be a subset of a space X. Let  $x \in rgwaint(A) \Rightarrow x \in \bigcup \{G : G \text{ is } rgw\alpha\text{-open } G \subseteq A\}$

$\Rightarrow \exists$  an  $rgw\alpha$ -open set G s.t.  $x \in G \subseteq A$ , as every  $rgw\alpha$ -open set is an  $gsp$ -open set in X  $\Rightarrow x \in \bigcup \{G : G \text{ is } gsp\text{-open } G \subseteq A\} \Rightarrow x \in gspint(A)$ .

Thus,  $x \in rgwaint(A) \Rightarrow x \in gspint(A)$  Hence,  $rgwaint(A) \subseteq gspint(A)$ .

**Theorem 5.22:** For any subset A of X

i)  $X\text{-}rgwaint(A) = rgw\alpha cl(X-A)$

ii)  $X\text{-}rgw\alpha cl(A) = rgwaint(X-A)$

**Proof:**  $x \in X\text{-}rgwaint(A)$ , then x is not in  $rgwaint(A)$  i.e. every  $rgw\alpha$ -open set G containing x such that  $G \subseteq A$ . This implies every  $rgw\alpha$ -open set G containing x intersects  $(X-A)$  i.e.  $G \cap (X-A) \neq \emptyset$ . Then by theorem 5.7  $x \in rgw\alpha cl(X-A)$   
 Therefore  $X\text{-}rgw\alpha cl(A) \subseteq rgw\alpha cl(X-A)$ ---(1)

and let  $x \in rgw\alpha cl(X-A)$ , then every  $x \in rgw\alpha$ -open set G containing x intersects  $X-A$  i.e.  $G \cap (X-A) \neq \emptyset$ . i.e. every  $rgw\alpha$ -open set G containing x s.t.  $G \subseteq A$ . Then by definition 5.12. x is not in  $rgw\alpha cl(A)$ , i.e.  $x \in X\text{-}rgwaint(A)$  and so  $rgw\alpha cl(X-A) \subseteq X\text{-}rgwaint(A)$ ---(2)

Thus  $X\text{-}rgwaint(A) = rgw\alpha cl(X-A)$ . Similarly we can prove ii).

## 6. $rgw\alpha$ -Neighbourhood and $rgw\alpha$ -Limit points

In this section we define the notation of  $rgw\alpha$ -Neighbourhood,  $rgw\alpha$ -Limit points and  $rgw\alpha$ -Derived set and some of their basic properties and analogous to those for open sets.

**Definition 6.1:** Let  $(X, \tau)$  be a topological space and let  $x \in X$ , A subset  $N$  of  $X$  is said to be  $rgw\alpha$ -Neighbourhood of  $x$  if there exists an  $rgw\alpha$ -open set  $G$  s.t.  $x \in G \subseteq N$ .

**Definition 6.2:** i) Let  $(X, \tau)$  be a topological space and  $A$  be a subset of  $X$ , A subset  $N$  of  $X$  is said to be  $rgw\alpha$  Neighbourhood of  $A$ , if there exists an  $rgw\alpha$ -open set  $G$  s.t.  $A \subseteq G \subseteq N$

ii) The collection of all  $rgw\alpha$ -Neighbourhood of  $x \in X$  called  $rgw\alpha$ -Neighbourhood system at  $x$  and shall be denoted by  $rgw\alpha N(x)$

**Definition 6.3:** i) Let  $(X, \tau)$  be a topological space and  $A$  be a subset of  $X$ , then a point  $x \in X$  is called a  $rgw\alpha$ -Limit point of  $A$  if every  $rgw\alpha$ -Neighbourhood of  $x$  contains a point of  $A$  distinct from  $x$  i.e.  $(N - \{x\}) \cap A \neq \emptyset$  for each  $rgw\alpha$ -Neighbourhood  $N$  of  $x$ . Also equivalently iff, every  $rgw\alpha$ -open set  $G$  containing  $x$  contains a point of  $A$  other than  $x$ .

ii) The set of all  $rgw\alpha$ -Limit points of the set  $A$  is called Derived set of  $A$  and is denoted by  $rgwad(A)$ .

**Theorem 6.4:** Every neighbourhood  $N$  of  $x \in X$  is called is a  $rgw\alpha$ -Neighbourhood of  $x \in X$ .

**Proof:** Let  $N$  be neighbourhood of point  $x \in X$ . To prove that  $N$  is a  $rgw\alpha$ -Neighbourhood of  $x$  by definition of neighbourhood,  $\exists$  an open set  $G$  s.t.  $x \in G \subseteq N \Rightarrow \exists$  an  $rgw\alpha$ -open set  $G$  s.t.  $x \in G \subseteq N$ , as every open set is  $rgw\alpha$ -open set. Hence  $N$  is  $rgw\alpha$ -Neighbourhood of  $x$ ,

**Remark 6.5:** In general, a  $rgw\alpha$ -nbhd  $N$  of  $x \in X$ . need not be a nbhd of  $x$  in  $X$ , as seen from the following example.

**Example 6.6 :** Let  $X = \{a, b, c, d, e\}$  with topology  $\tau = \{x, \phi, \{a\}, \{d\}, \{e\}, \{a, d\}, \{a, e\}, \{d, e\}, \{a, d, e\}\}$ . The set  $\{a, b\}$  is  $rgw\alpha$ -Neighbourhood of the point  $b$ , since  $\exists$  the  $rgw\alpha$ -open set  $\{b\}$  s.t.  $b \in \{b\} \subseteq \{a, b\}$ , However the set  $\{a, b\}$  is not a nbhd of the point  $b$ . Since no open set  $G$  exists s.t.  $b \in G \subseteq \{a, b\}$

**Theorem 6.7:** If a subset  $N$  of a space  $X$  is  $rgw\alpha$ -open, then  $N$  is  $rgw\alpha$ -nbhd of each of its points.

**Proof:** Suppose  $N$  is  $rgw\alpha$ -open. Let  $x \in N$ . We claim that  $N$  is  $rgw\alpha$ -nbhd of  $x$ . For  $N$  is a  $rgw\alpha$ -open set such that  $x \in N \subseteq N$ . Since  $x$  is an arbitrary point of  $N$ , it follows that  $N$  is a  $rgw\alpha$ -nbhd of each of its points.

**Remark 6.8:** Let  $X = \{a, b, c, d, e\}$  with topology  $\tau = \{X, \phi, \{a\}, \{d\}, \{e\}, \{a, d\}, \{a, e\}, \{d, e\}, \{a, d, e\}\}$ . The set  $\{b, c\}$  is a  $rgw\alpha$ -nbhd of the point  $b$ , since the  $rgw\alpha$ -open set  $\{b\}$  is s.t.  $b \in \{b\} \subseteq \{b, c\}$ , Also the set  $\{b, c\}$  is  $rgw\alpha$ -nbhd of the point  $c$ , Since the  $rgw\alpha$ -open set  $\{c\}$  is s.t.  $c \in \{c\} \subseteq \{b, c\}$ . That is  $\{b, c\}$  is a  $rgw\alpha$ -nbhd of each of its points. However the set  $\{b, c\}$  is not  $rgw\alpha$ -open set in  $X$ .

**Theorem 6.10:** Let  $X$  be a topological space. If  $F$  is a  $rgw\alpha$ -closed subset of  $X$ , and  $x \in F^c$ . Prove that there exists  $rgw\alpha$ -nbhd  $N$  of  $x$  such that  $N \cap F = \emptyset$ . **Proof:** let  $F$  be  $rgw\alpha$ -closed subset of  $X$  and  $x \in F^c$ . Then  $F^c$  is  $rgw\alpha$ -open set of  $X$ . So by theorem 6.7  $F^c$  contains a  $rgw\alpha$ -nbhd of each of its points. Hence there exists a  $rgw\alpha$ -nbhd of  $N$  of  $x$  such that  $N \subseteq F^c$ . That is  $N \cap F = \emptyset$ .

**Theorem 6.11:** Let  $X$  be a topological space and for each  $x \in X$ , Let  $rgw\alpha$ - $N(x)$  be the collection of all  $rgw\alpha$ -nbhd of  $x$ . Then we have following results.

- i)  $\forall x \in X, rgw\alpha$ - $N(x) \neq \emptyset$ .

- ii)  $N \in rgw\alpha\text{-}N(x) \Rightarrow x \in N$ .
- iii)  $N \in rgw\alpha\text{-}N(x), M \supset N \Rightarrow M \in rgw\alpha\text{-}N(x)$
- iv)  $N \in rgw\alpha\text{-}N(x), M \in rgw\alpha\text{-}N(x) \Rightarrow N \cap M \in rgw\alpha\text{-}N(x)$
- v)  $N \in rgw\alpha\text{-}N(x) \Rightarrow$  There exists  $M \in rgw\alpha\text{-}N(x)$  such that  $M \in N$  &  $M \in rgw\alpha\text{-}N(y)$ , for every  $y \in M$ .

**Proof:** i) Since  $X$  is a  $rgw\alpha$ -open set, it is  $rgw\alpha$ -nbhd of every  $x \in X$ . Hence there exists at least one  $rgw\alpha$ -nbhd (namely  $X$ ) for each  $x \in X$ . Hence  $rgw\alpha\text{-}N(x) \neq \emptyset$  for every  $x \in X$ .

ii) If  $N \in rgw\alpha\text{-}N(x)$ , then  $N$  is a  $rgw\alpha$ -nbhd of  $x$ , so by definition of  $rgw\alpha$ -nbhd,  $x \in N$ . Let  $N \in rgw\alpha\text{-}N(x)$  and  $M \in N$ . Then there is a  $rgw\alpha$ -open set  $G$  such that  $x \in G \subset N$ . Since  $N \subset M$ ,  $x \in G \subset M$  and so  $M$  is  $rgw\alpha$ -nbhd of  $x$ . Hence  $M \in rgw\alpha\text{-}N(x)$ .

iv) Let  $N \in rgw\alpha\text{-}N(x)$  and  $M \in rgw\alpha\text{-}N(x)$ . Then by definition of  $rgw\alpha$ -nbhd there exists  $rgw\alpha$ -open sets  $G_1$  and  $G_2$  such that  $x \in G_1 \subset N$  and  $x \in G_2 \subset M$ .

Hence  $x \in G_1 \cap G_2 \subset N \cap M$ ---(1). Since  $G_1 \cap G_2$  is a  $rgw\alpha$ -open set (being the intersection of two  $rgw\alpha$ -open sets) it follows from (1) that  $N \cap M$  is also  $rgw\alpha$ -nbhd of  $x$ . Hence  $N \cap M \in rgw\alpha\text{-}N(x)$ .

v) If  $N \in rgw\alpha\text{-}N(x)$ , then there exists a  $rgw\alpha$ -open set  $M$  such that  $x \in M \subset N$ . Since  $M$  is  $rgw\alpha$ -open set, it is  $rgw\alpha$ -nbhd of each of its points. Therefore  $M \in rgw\alpha\text{-}N(y)$  for every  $y \in M$ .

**Theorem 6.12:** Let  $X$  be a non empty set, and for each  $x \in X$ , let  $rgw\alpha\text{-}N(x)$  be a nonempty collection of subsets of  $X$  satisfying following conditions.

- i)  $N \in rgw\alpha\text{-}N(x) \Rightarrow x \in N$
- ii)  $N \in rgw\alpha\text{-}N(x), M \in rgw\alpha\text{-}N(x) \Rightarrow N \cap M \in rgw\alpha\text{-}N(x)$

Let  $\tau$  consists of the empty set and all those non-empty subsets of  $G$  of  $X$  having the property that  $x \in G$  implies that there exists an  $N \in rgw\alpha\text{-}N(x)$  such that  $x \in N \subset G$ . Then  $\tau$  is a topology for  $X$ .

**Proof:**

- (i)  $\emptyset \in \tau$  by definition. We now show that  $X \in \tau$ . Let  $x$  be any arbitrary element of  $X$ . Since  $rgw\alpha\text{-}N(x)$  is nonempty, there is  $N \in rgw\alpha\text{-}N(x)$  and so  $x \in N$  by (i). Since  $N$  a subset of  $X$ , we have  $x \in N \subset X$ . Hence  $X \in \tau$ .
- (ii) Let  $G_1 \in \tau$  and  $G_2 \in \tau$ . if  $x \in G_1 \cap G_2$  Then  $x \in G_1, x \in G_2$ . Since  $G_1 \in \tau, G_2 \in \tau$ , there exist  $N \in rgw\alpha\text{-}N(x)$  and  $M \in rgw\alpha\text{-}N(x)$ , such that  $x \in N \subset G_1$  and  $x \in M \subset G_2$ . Then  $x \in N \cap M \subset G_1 \cap G_2$ . But  $N \cap M \in rgw\alpha\text{-}N(x)$  by theorem 6.11 (iv) Hence  $G_1 \cap G_2 \in \tau$ .
- (iii) Let  $G_\lambda \in \tau$  for every  $\lambda \in \Lambda$ . If  $x \in \bigcup \{G_\lambda : \lambda \in \Lambda\}$ , then  $x \in G_{\lambda_x}$  for some  $\lambda_x \in \Lambda$ . Since  $G_{\lambda_x} \in \tau$ , there exists an  $N \in rgw\alpha\text{-}N(x)$  such that  $x \in N \subset G_{\lambda_x}$  and consequently  $x \in N \subset \bigcup \{G_\lambda : \lambda \in \Lambda\}$ . Hence  $\bigcup \{G_\lambda : \lambda \in \Lambda\} \in \tau$ . It follows that  $\tau$  is a topology for  $X$ .

**Theorem 6.13:** Let  $X$  be a topological space then

- i)  $rgwad(A) = \emptyset$
- ii) If  $A \subset B \Rightarrow rgwad(A) \subset rgwad(B)$
- iii)  $rgwad(A \cup B) = rgwad(A) \cup rgwad(B)$

**Proof:** i) Suppose that  $rgwad(A) \neq \emptyset$  then  $rgwad(A)$  contains at least one element. Therefore let  $x \in rgwad(\emptyset)$  then  $x$  is a  $rgw\alpha$ -Limit point of  $\emptyset$  therefore for every  $rgw\alpha$ -open set  $G$  containing 'x',  $(G - \{x\}) \cap \emptyset \neq \emptyset$ , But this is not true. Since intersection of  $\emptyset$  with any set is again a  $\emptyset$ . Therefore  $rgwad(A) = \emptyset$ .

ii) Given  $A \subset B$  to prove  $rgwad(A) \subset rgwad(B)$ . let  $x \in rgwad(A)$ .  $\Rightarrow x$  is a  $rgw\alpha$ -limit point of  $A$ . Therefore by definition,  $\exists$  an  $rgw\alpha$ -open set  $G$  containing  $x$  such that  $(G - \{x\}) \cap A \neq \emptyset$ ---(1). But  $A \subset B \Rightarrow A - \{x\} \subset B - \{x\} \Rightarrow (G - \{x\}) \cap B \neq \emptyset$ .  $\Rightarrow x$  is a  $rgw\alpha$ -limit point of  $B \Rightarrow x \in rgwad(B)$ . Thus  $x \in rgwad(A) \Rightarrow x \in rgwad(B)$ . Therefore  $rgwad(A) \subset rgwad(B)$

iii) We have  $A \subset A \cup B$  and  $B \subset A \cup B$ . Therefore  $rgwad(A) \subset rgwad(A \cup B)$  and  $rgwad(B) \subset rgwad(A \cup B)$ . Therefore  $rgwad(A) \cup rgwad(B) \subset rgwad(A \cup B)$ . ---(1). To prove  $rgwad(A \cup B) \subset rgwad(A) \cup rgwad(B)$ . Let  $x \in rgwad(A \cup B) \Rightarrow x$  is  $rgw\alpha$ -limit point of  $(A \cup B)$ .

$\Rightarrow (G - \{x\}) \cap (A \cup B) \neq \emptyset$  for every  $rgw\alpha$ -open set  $G$  containing  $x$ .  $\Rightarrow [(G - \{x\}) \cap A] \cup [(G - \{x\}) \cap B] \neq \emptyset \Rightarrow (G - \{x\}) \cap A \neq \emptyset$  or  $(G - \{x\}) \cap B \neq \emptyset \Rightarrow x$  is a  $rgw\alpha$ -limit point of  $A$  or  $x$  is a  $rgw\alpha$ -limit point of  $B$ . i.e.  $x \in rgwad(A)$  or  $x \in rgwad(B)$  therefore  $x \in rgwad(A) \cup rgwad(B)$ .

For  $x \in rgwad(A \cup B) \Rightarrow x \in rgwad(A) \cup rgwad(B)$ .  $\Rightarrow rgwad(A \cup B) \subset rgwad(A) \cup rgwad(B)$ ---(2)

$\Rightarrow$  From (1) and (2)  $rgwad(A \cup B) = rgwad(A) \cup rgwad(B)$

**Theorem 6.14:** Let  $X$  be a topological space and  $A \subset X$ . Then  $AUrgwad(A)$  is  $rg\omega\alpha$ -closed set in  $X$ .

**Proof:** To prove  $AUrgwad(A)$  is a  $rg\omega\alpha$ -closed set in  $X$ . that is to prove  $X - AUrgwad(A)$  is an  $rg\omega\alpha$ -open set in  $X$ .  
 Let  $x \in X - AUrgwad(A) \Rightarrow x \in X$  &  $x \notin AUrgwad(A) \Rightarrow x \in X$  &  $(x \notin A$  &  $x \notin rgwad(A)) \Rightarrow x \in X$  &  $(x \notin A$  &  $x$  is not a limit point of  $A$ ).  
 $\Rightarrow x \in X, x \notin A$ , there exist an  $rg\omega\alpha$ -open set  $G$  containing  $x$  s.t.  $G \cap (A - \{x\}) = \emptyset$  i.e.  $G \cap A = \emptyset$ . Further,  $G \cap rgwad(A) = \emptyset$ . Let  $y \in G$ . then  $y \notin A$  because  $G \cap A = \emptyset$ . Now  $G$  is an  $rg\omega\alpha$ -open set containing  $y$  and  $G \cap A = \emptyset$  and  $y \in A$ . therefore  $G$  is an  $rg\omega\alpha$ -open set containing  $y$  s.t.  $G \cap (A - \{y\}) = \emptyset$ . Therefore there exist an  $rg\omega\alpha$ -open set  $G$  containing  $y$  s.t.  $G \cap (A - \{y\}) = \emptyset$ . Therefore  $y$  is not a limit point of  $A$ . i.e.  $y \notin rgwad(A)$ .  
 $y \in G, y \notin rgwad(A)$ . therefore  $G \cap rgwad(A) = \emptyset$ . Thus we have  $G \cap A = \emptyset$  and  $G \cap rgwad(A) = \emptyset$ .  
 $\Rightarrow (G \cap A) \cup (G \cap rgwad(A)) = \emptyset$ .  
 $\square G \cap AUrgwad(A) = \emptyset \Rightarrow G \subset X - AUrgwad(A)$ . Thus for all  $x \in X - (AUrgwad(A))$  there exist an open set  $G$  s.t.  $x \in G \subset X - (AUrgwad(A)) \Rightarrow X - (AUrgwad(A))$  is an  $rg\omega\alpha$ -open set. Therefore  $AUrgwad(A)$  must be  $rg\omega\alpha$ -closed set in  $X$ .

**Theorem 6.15:** Let  $X$  be a topological space and  $A \subset X$ , then  $A$  is  $rg\omega\alpha$ -closed iff  $A \supset rgwad(A)$  i.e.  $A$  is  $rg\omega\alpha$ -closed if and only if  $A$  contains all its  $rg\omega\alpha$ -limit points. i.e.  $A$  is  $rg\omega\alpha$ -closed if and only if  $rgwad(A) \subset A$ .

**Proof:** Suppose  $A$  is  $rg\omega\alpha$ -closed set, To prove  $A \supset rgwad(A)$  i.e.  $rgwad(A) \subset A$ . Let  $x \notin A$ , we prove  $x \notin rgwad(A)$ . Since  $x \notin A$ , we have  $x \in X - A$ .

Now  $X - A$  is an  $rg\omega\alpha$ -open set containing  $x$  and  $(X - A) \cap A = \emptyset$ . i.e.  $(X - A) \cap (A - \{x\}) = \emptyset$ . There exist an  $rg\omega\alpha$ -open set  $(X - A)$  containing  $x$  s.t.  $(X - A) \cap (A - \{x\}) = \emptyset$ . Therefore  $x$  is not a limit point of  $A$ .  $x \notin rgwad(A)$ . Thus  $x \notin A \Rightarrow x \notin rgwad(A)$ . therefore  $A \supset rgwad(A)$  i.e.  $rgwad(A) \subset A$ .

Conversely, on the other hand suppose  $A \supset rgwad(A)$  i.e.  $rgwad(A) \subset A$ . we prove  $A$  is  $rg\omega\alpha$ -closed set i.e. we prove  $X - A$  is  $rg\omega\alpha$ -open set.

Let  $x \in X - A \Rightarrow x \notin A \Rightarrow x \notin rgwad(A)$ .  $\Rightarrow x$  is not a limit point of  $A$ .  $\Rightarrow$  there exist an  $rg\omega\alpha$ -open set  $G$  containing  $x$  s.t.  $G \cap (A - \{x\}) = \emptyset \Rightarrow$  there exist an  $rg\omega\alpha$ -open set  $G$  containing  $x$  s.t.  $G \cap A = \emptyset \Rightarrow$  there exist an  $rg\omega\alpha$ -open set  $G$  containing  $x$  s.t.  $G \subset X - A \Rightarrow$  there exist an  $rg\omega\alpha$ -open set  $G$  containing  $x$  s.t.  $x \in G \subset X - A$ . for all  $x \in X - A$  there exist an  $rg\omega\alpha$ -open set  $G$  containing  $x$  s.t.  $x \in G \subset X - A$ . therefore  $(X - A)$  must be an  $rg\omega\alpha$ -open set. Therefore  $A$  must be a  $rg\omega\alpha$ -closed set.

**Theorem 6.16:** Let  $X$  be topological space and  $A \subset X$  then  $rg\omega\alpha cl(A) = AUrgwad(A)$ .

**Proof:** w.k.t.  $AUrgwad(A)$  is  $rg\omega\alpha$ -closed set in  $X$ . Also we have  $A \subset AUrgwad(A)$ . Therefore  $AUrgwad(A)$  is a closed set containing  $A$ . But  $rg\omega\alpha cl(A)$  is the smallest closed set containing  $A$ . Therefore  $rg\omega\alpha cl(A) \subset AUrgwad(A)$ . (1)

Further we have  $A \subset rgwad(A)$  (i). To prove  $rgwad(A) \subset rg\omega\alpha cl(A)$ . Let  $x \in rgwad(A)$ .  $\Rightarrow x$  is a  $rg\omega\alpha$ -limit point of  $A$ . We prove that  $x \in rg\omega\alpha cl(A)$ . If possible let  $x \notin rg\omega\alpha cl(A)$ . Then  $x \in X - rg\omega\alpha cl(A)$ , Therefore  $X - rg\omega\alpha cl(A)$  is an  $rg\omega\alpha$ -open set containing  $x$  and  $[X - rg\omega\alpha cl(A)] \cap [A - \{x\}] = \emptyset$ . Therefore  $x$  is not a limit point of  $A$ . Which is wrong. Therefore  $x \in rg\omega\alpha cl(A)$ . If  $x \in rgwad(A)$  then  $x \in rg\omega\alpha cl(A) \Rightarrow rgwad(A) \subset rg\omega\alpha cl(A)$  (ii)

From (i) and (ii)  $AUrgwad(A) \subset rg\omega\alpha cl(A)$  (2)

From (1) and (2)  $rg\omega\alpha cl(A) = AUrgwad(A)$ .
