#### Abstract

A total coloring of a graph $G$ is an assignment of colors to both the vertices and edges of $G$ such that adjacent or incident elements of $G$ are not colored with the same color. The total chromatic number of a graph $G$ is a smallest positive integer for which $G$ admits a total coloring. In this paper, we obtain the total chromatic number of Star, Wheel and helm graph.

Keywords: Total coloring, total chromatic number Star, Wheel, and Helm graph.
AMS Classification Number: 05C15.

## 1. INTRODUCTION

A proper k-coloring of a graph $G$ is a function $C: V(G) \rightarrow\{1,2, \ldots k)$ such that $C(u) \neq C(v)$, for all uv $\in E(G)$. The chromatic number denoted by $\chi(\mathrm{G})$, is the minimum number k for which the graph G admits a proper coloring. A total coloring of a graph G is a coloring of all elements of G , i.e. vertices and edges, so that no two adjacent or incident elements receive the same color. The minimum number of colors is called the total chromatic number $\chi_{\mathrm{T}}(\mathrm{G})$ of G . Total coloring conjecture posed independently by Behzad [2] and Vizing [10].It states that every graph of maximum degree $\Delta$ admits a $(\Delta+2)$ total coloring Molloy and Reed [7] established a best bound for total coloring as $\left(\Delta+10^{26}\right)$ for each graph of maximum. degree $\Delta$. The Conjecture has been proved for graphs with maximum. degree 3 by Rosenfielf [8] and Vijayaditya [11] and with $\Delta \in\{4,5\}$ by Kostochka [6]. The survey of total colorings of graphs has been given in a paper by Behazed [3]. Behzad et al. [4] has also proved TCC for complete graphs. The TCC for complete multipartite graphs have been proved by yap [15], Anderson [1], Sanders and Zheo [9], Borodin [5] have proved the TCC for planar graphs $G$ with $\Delta(G) \neq 5$. The Concept of total coloring is explored by Xie and Yang [14], Wang [12] and Wang et.al. [13].

Conjecture 1.1: $\Delta(\mathrm{G})+1 \leq \chi_{\mathrm{T}} \mathrm{G} \leq \Delta(\mathrm{G})+2$.

Proposition 1.2: A graph $G$ is said to be of type $I$ if $\chi_{T}(G)=\Delta(G)+1$ and is of type II if $\chi_{\mathrm{T}}(\mathrm{G})=\Delta(\mathrm{G})+2$.

## 2. TOTAL COLORING OF STAR GRAPH FAMILY

In this section, we discuss the total chromatic number of Star graph
2.1 Definition: In graph theory, a star $S_{k}$ is the complete bipartite graph $K_{1, k}$ : a tree with one internal node and $k$ leaves. Alternatively, some authors define $\mathrm{S}_{\mathrm{k}}$ to be the tree of order k with maximum diameter 2 ; in which case a star of $\mathrm{k}>2$ has $\mathrm{k}-1$ leaves.

Figure-1: Star Graph $\mathrm{K}_{1,5}$

### 2.2 Coloring Algorithm

Input; $\mathrm{K}_{1, \mathrm{n}}, \mathrm{n} \geq 1$
$V \leftarrow \ldots\left\{\mathrm{v}_{1}, \mathrm{v}_{2}, \mathrm{v}_{3} \ldots \ldots . \mathrm{v}_{\mathrm{n}}\right)$
$\mathrm{E} \leftarrow\left\{\mathrm{x}_{\mathrm{k}} \leftarrow \mathrm{vv}_{\mathrm{k}} ; \mathrm{k}=1\right.$ to n$\}$
$\mathrm{v} \leftarrow 1$;
for $\mathrm{k}=1$ to n
\{

$$
\mathrm{x}_{\mathrm{k}} \leftarrow \mathrm{k}+1
$$

\}
end for
for $k=1$ to $n-1$
\{

$$
\mathrm{v}_{\mathrm{k}} \leftarrow \mathrm{k}+2
$$

\}
end for
$\mathrm{v}_{\mathrm{n}} \leftarrow 2$;
end procedure
Output: vertex and edge colored $\mathrm{K}_{1, \mathrm{n}}$.
2.3 Theorem: The total chromatic number of star graph $K_{1, n}(n \geq 4)$ is $n+1$
(i-e) $\chi_{\mathrm{T}}\left(\mathrm{K}_{1, \mathrm{n}}\right)=\mathrm{n}+1, \mathrm{n} \geq 4$
Proof: Since $\Delta\left(\mathrm{K}_{1, \mathrm{n}}\right)=\mathrm{n}$, we need minimum $\mathrm{n}+1$ colors for proper coloring. Therefore, $\chi_{\mathrm{T}}\left(\mathrm{K}_{1, \mathrm{n}}\right) \geq \mathrm{n}+1$. Consider the color classes of $K_{1, n}$. The color class of 1 and 2 are $\{v\}$ and $\left\{x_{1}, v_{n}\right\}$ respectively. The color class of $k(k=3$ to $n+1)$ is ( $\left.\mathrm{x}_{\mathrm{k}-1}, \mathrm{v}_{\mathrm{k}-2}\right\}$. The elements of each of these color classes are neither incident nor adjacent. Therefore, the above coloring is a total coloring.

$$
\therefore \chi_{\mathrm{T}}\left(\mathrm{~K}_{1}, \mathrm{n}\right)=\mathrm{n}+1, \mathrm{n} \geq 4
$$

Remark: The total chromatic number of $K_{1,4}$ is $\chi_{T}\left(\mathbf{K}_{1,4}\right)=\mathbf{5}$

Figure-2: $\chi_{T}\left(K_{1,4}\right)=5$

## 3. TOTAL COLORING OF WHEEL GRAPH FAMILY

In this section, we discuss the total chromatic number of Wheel graph
3.1 Definition: A wheel graph is a graph formed by connecting a single vertex to all vertices of a cycle. A Wheel graph with one internal vertex \& $n$ leaves is denoted by $W_{n}$. A wheel graph with $n$ vertices can also be defined as the 1 -Skeleton of an ( $n-1$ ) - gonal pyramid.

Figure-3: Wheel Graph $\mathrm{W}_{5}$

### 3.2 Coloring algorithm

Input; $\mathrm{W}_{\mathrm{n}}, \mathrm{n} \geq 4$
$\mathrm{V} \leftarrow\left\{\mathrm{v}, \mathrm{v}_{1}, \mathrm{v}_{2}, \ldots \ldots \mathrm{v}_{\mathrm{n}}\right)$
$\mathrm{E} \leftarrow\left\{\mathrm{x}_{\mathrm{k}} \leftarrow \mathrm{vv}_{\mathrm{k}}(\mathrm{k}=1\right.$ to n$\} ;$
$\mathrm{y}_{\mathrm{k}} \leftarrow \mathrm{v}_{\mathrm{k}} \mathrm{V}_{\mathrm{k}+1}(\mathrm{k}=1$ to $\mathrm{n}-1) ;$
$\left.\mathrm{y}_{\mathrm{n}} \leftarrow \mathrm{v}_{\mathrm{n}} \mathrm{v}_{1}\right\}$
$\mathrm{v} \leftarrow 1$;
for $\mathrm{k}=1$ to n

$$
\mathrm{x}_{\mathrm{k}}^{\{ } \leftarrow \mathrm{k}+1
$$

end for
for $\mathrm{k}=1$ to $\mathrm{n}-1$

$$
\begin{aligned}
& \{ \\
& \mathrm{v}_{\mathrm{k}} \leftarrow \mathrm{k}+2 \text {; } \\
& \}
\end{aligned}
$$

end for
$\mathrm{v}_{\mathrm{n}} \leftarrow 2$
for $\mathrm{k}=1$ to n
\{
$\mathrm{t} \leftarrow \mathrm{k}+4$;
if $\mathrm{t} \leq \mathrm{n}+1$;
$\mathrm{y}_{\mathrm{k}} \leftarrow \mathrm{t}$;
else
$\mathrm{y}_{\mathrm{k}} \leftarrow \mathrm{t}-\mathrm{n}$;
\}
end for
end procedure
Output: vertex and edge colored $\mathrm{W}_{\mathrm{n}}$
3.3 Theorem: The total chromatic number of wheel Graph $W_{n}$ is $n+1, n \geq 4$, (i-e) $\chi_{T}\left(W_{n}\right)=n+1, n \geq 4$,

Proof: Since $\Delta\left(W_{n}\right)=n$, We need minimum ( $\mathrm{n}+1$ ) colors for proper coloring.
$\therefore \chi_{\mathrm{T}}\left(\mathrm{W}_{\mathrm{n}}\right) \geq \mathrm{n}+1$. Consider the color classes of $\mathrm{W}_{\mathrm{n}}$.
The color class of 1 is $\{\nu\}$. The color class of $k(2 \leq k \leq n+1)$ is $\left\{v_{t}, x_{k-1}, y_{s} ; t=k-2\right.$ if $k>2$ and $t=n$ if $k=2, s=k-4$ if $\mathrm{k}>4$ and $\mathrm{s}=\mathrm{n}+\mathrm{k}-4$ if $2 \leq \mathrm{k} \leq 4\}$. The elements of each of these color classes are neither adjacent nor incident. Therefore, the coloring given in 3.1 is a total coloring.

$$
\therefore \chi_{\mathrm{T}}\left(\mathrm{~W}_{\mathrm{n}}\right)=\mathrm{n}+1, \mathrm{n} \geq 4,
$$

Figure-4: $\chi_{\tau}\left[W_{5}\right]=6$

## 4. TOTAL COLORING OF HELM GRAPH FAMILY

In this section, we discuss the total chromatic number of Helm graph.
4.1 Definition: A helm graph, denoted by $\mathbf{H}_{\mathbf{n}}$ is a graph obtained by attaching a single edge and node to each node of the outer circuit of a wheel graph $\mathbf{W}_{\mathrm{n}}$.

Figure-5: Helm Graph $\mathrm{H}_{5}$

### 4.2 Coloring Algorithm

Input: $\mathrm{H}_{\mathrm{n}}, \mathrm{n} \geq 4$
$\mathrm{v} \leftarrow\left\{\mathrm{v}, \mathrm{v}_{1}, \mathrm{v}_{2}, \ldots . . \mathrm{v}_{\mathrm{n}}, \mathrm{w}_{1}, \mathrm{w}_{2}, \ldots . \mathrm{w}_{\mathrm{n}}\right\}$
$\mathrm{E} \leftarrow\left\{\mathrm{x}_{\mathrm{k}} \leftarrow \mathrm{vv}_{\mathrm{k}}(\mathrm{k}=1\right.$ to n$)$,
$\mathrm{y}_{\mathrm{k}} \leftarrow \mathrm{v}_{\mathrm{k}} \mathrm{v}_{\mathrm{k}+1}(\mathrm{k}=1$ to $\mathrm{n}-1), \mathrm{y}_{\mathrm{n}} \leftarrow \mathrm{v}_{\mathrm{n}} \mathrm{v}_{1}$,
$\mathrm{z}_{\mathrm{k}} \leftarrow \mathrm{v}_{\mathrm{k}} \mathrm{W}_{\mathrm{k}}(\mathrm{k}=1$ to n$\left.)\right\}$
$\mathrm{v} \leftarrow 1$;
for $\mathrm{k}=1$ to n

$$
\left\{\begin{array}{l} 
\\
\quad x_{\mathrm{k}} \leftarrow \mathrm{k}+1 ;
\end{array}\right.
$$

\}
end for.
for $\mathrm{k}=1$ to $\mathrm{n}-1$
\{

$$
\mathrm{v}_{\mathrm{k}} \leftarrow \mathrm{k}+2
$$

\}
end for
$\mathrm{v}_{\mathrm{n}} \leftarrow 2$;
for $\mathrm{k}=1$ to n

```
    {
    t\leftarrowk+4;
    if t\leqn+1;
    yk}\leftarrow\textrm{t}\mathrm{ ;
    else
    yk}\leftarrow\textrm{t}-\textrm{n}
    }
end for
for k=1 to n
    {
    \mp@subsup{z}{k}{}}\leftarrow1
    }
end for
for k=1 to n
            {
            s}\leftarrow\textrm{k}+1
            if s\leqn+1;
            w
        else
        w
    }
end for
end procedure
```

Output: vertex and edge colored $\mathrm{H}_{\mathrm{n}}$.
4.3 Theorem: The total chromatic number of Helm Graph $H_{n}$ is $n+1, n \geq 4$
(i.e) $\chi_{\mathrm{T}}\left(\mathrm{H}_{\mathrm{n}}\right)=\mathrm{n}+1, \mathrm{n} \geq 4$

Proof: Since $\Delta\left(H_{n}\right)=n,(n+1)$ colors are required for proper coloring and hence $\chi_{T}\left(H_{n}\right) \geq n+1$ Now, the color class of 1 is $\left\{\mathrm{v}, \mathrm{z}_{\mathrm{k}}(\mathrm{k}=1\right.$ to n$\left.)\right\}$. The color class of k . $(2 \leq \mathrm{k} \leq \mathrm{n}+1)$ is $\left\{\mathrm{v}_{\mathrm{t}}, \mathrm{x}_{\mathrm{k}-1}, \mathrm{y}_{\mathrm{s}}, \mathrm{w}_{\mathrm{k}-1} ; \mathrm{t}=\mathrm{k}-2\right.$ if $\mathrm{k}>2$ and $\mathrm{t}=\mathrm{n}$ if $\mathrm{k}=2$, $\mathrm{s}=\mathrm{k}-4$, if $\mathrm{k}>4$ and $\mathrm{s}=\mathrm{n}+\mathrm{k}-4,2 \leq \mathrm{k} \leq 4\}$. The elements in each color classes are neither incident nor adjacent.

Therefore, the coloring given in the algorithm 4.1 is a total coloring of $H_{n}$.

$$
\chi_{\mathrm{T}}\left(\mathrm{H}_{\mathrm{n}}\right)=\mathrm{n}+1, \mathrm{n} \geq 4
$$

Figure-6: $\chi_{\mathrm{T}}\left(\mathrm{H}_{6}\right)=7$

## CONCLUSION

In this paper we have obtained the following results.

1. The total chromatic number of $\mathrm{K}_{1}, \mathrm{n}$ is $\chi_{\mathrm{T}}\left(\mathrm{K}_{1}, \mathrm{n}\right)=\mathrm{n}+1 \mathrm{n} \geq 4$
2. The total chromatic number of $\mathrm{W}_{\mathrm{n}}$ is $\chi_{\mathrm{T}}\left(\mathrm{W}_{\mathrm{n}}\right)=\mathrm{n}+1, \mathrm{n} \geq 4$
3. The total chromatic number of $\mathrm{H}_{\mathrm{n}}$ is $\chi_{\mathrm{T}}\left(\mathrm{H}_{\mathrm{n}}\right)=\mathrm{n}+1, \mathrm{n} \geq 4$
