#### Abstract

In this paper, the authors obtain some new sufficient conditions for the oscillation of all solutions of certain class of second order difference equations with nonlinear neutral term. Examples are included to illustrate the main results.

AMS Subject Classification: 39A11.
Keywords: Oscillation, nonlinear neutral term, second order.

## INTRODUCTION

Consider the nonlinear neutral difference equation of the form

$$
\begin{equation*}
\Delta\left(a_{n} \Delta\left(x_{n}+p_{n} x_{n-k}^{\alpha}\right)\right)+q_{n} x_{n+1-l}^{\beta}=0, n \geq n_{0} \tag{1}
\end{equation*}
$$

where $n_{0}$ is a nonnegative integer, subject to the following conditions:
$\left(\mathrm{H}_{1}\right) 0<\alpha \leq 1$ and $\beta$ are ratios of odd positive integers;
$\left(\mathrm{H}_{2}\right)\left\{a_{n}\right\}$ is a positive real sequence for all $n \geq n_{0}$;
$\left(\mathrm{H}_{3}\right)\left\{p_{n}\right\}$ and $\left\{q_{n}\right\}$ are nonnegative real sequences for all $n \geq n_{0}$;
$\left(\mathrm{H}_{4}\right) k$ is a positive integer and $l$ is a nonnegative integer.
Let $\theta=\max \{k, l\}$. By a solution of equation (1), we mean a real sequence $\left\{x_{n}\right\}$ defined for all $n \geq n_{0}-\theta$, that satisfies equation (1) for all $n \geq n_{0}$. A solution of equation (1) is called oscillatory if its terms are neither eventually positive nor eventually negative, and nonoscillatory otherwise. If all solutions of the equation are oscillatory then the equation itself called oscillatory.

In the past few years, there has been a great interest in studying the oscillatory and asymptotic behavior of neutral type difference equations, see $[1-3,9]$ and the references cited therein.

In [5], Thandapani et.al investigated the oscillation of all solutions of the equation

$$
\begin{equation*}
\Delta\left(a_{n} \Delta\left(x_{n}-p_{n} x_{n-k}^{\alpha}\right)\right)+q_{n} x_{n+1-l}^{\beta}=0, n \geq n_{0} \tag{2}
\end{equation*}
$$

where $p>0$ is a real number, $k$ and $l$ are positive integers, $0<\alpha \leq 1$ and $\beta$ are ratios of odd positive integers, and $\sum_{n=n_{0}}^{\infty} \frac{1}{a_{n}}=\infty$.

A special case of the equation studied by Yildiz and Ogunmez [10] has the form

$$
\begin{equation*}
\Delta^{2}\left(x_{n}+p_{n} x_{n-k}^{\beta}\right)+q_{n} x_{n-l}^{\beta}=0, n \geq n_{0} \tag{3}
\end{equation*}
$$

where $\left\{p_{n}\right\}$ is a real sequence, $\left\{q_{n}\right\}$ is a nonnegative real sequence, and $\alpha>1$ and $\beta$ are again ratios of odd positive integers. They too discussed the oscillatory behavior of solutions of equation [3].

## B. Kamaraj $^{1^{*}}$ and R. Vasuki ${ }^{2}$ /

## Oscillation Criteria for Second Order Difference Equations with Nonlinear Neutral Term / IJMA-9(8), August-2018.

In [6] and [8], Thandapani et.al considered equation (1) and obtained criteria for the oscillation of solutions provided either

$$
\begin{equation*}
\sum_{n=n_{0}}^{\infty} \frac{1}{a_{n}}=\infty \tag{4}
\end{equation*}
$$

or

$$
\begin{equation*}
\sum_{n=n_{0}}^{\infty} \frac{1}{a_{n}}<\infty \tag{5}
\end{equation*}
$$

Using some inequalities and Riccati type transformation.
Motivated by this observation, in this paper we obtain sufficient conditions for the oscillation of all solutions of equation (1) in the two cases (4) and (5). Our method of proof is different from that of in $[6,8,10,11]$, and hence our results are new and complement to those reported in [5,6, 8, 10, 11]. Example are presented to illustrate the main results.

## OSCILLATION RESULTS

In this section, we obtain sufficient conditions for the oscillation of all solutions of the equation (1). We set

$$
z_{n}=x_{n}+p_{n} x_{n-k}^{\alpha}
$$

Due to the form of our equation, we only need to give proofs for the case of eventually positive solutions since the proofs for the eventually negative solutions would be similar.

We begin with the following theorem.
Theorem 1: Assume that $\left(H_{1}\right)-\left(H_{4}\right)$ and (4) hold. If

$$
\begin{equation*}
\sum_{n=n_{1}}^{\infty} q_{n}\left(M^{1-\alpha}-p_{n}\right)^{\beta}=\infty \tag{6}
\end{equation*}
$$

holds for all constants $M>0$, then every solution of equation (1) is oscillatory.
Proof: Assume to the contrary that equation (1) has an eventually positive solution $\left\{x_{n}\right\}$, say $x_{n}>0, x_{n-k}>0$, and $x_{n-l}>0$ for all $n \geq n_{1}$ for some $n_{1} \geq n_{0}$. From equation (1), we have

$$
\begin{equation*}
\Delta\left(a_{n} \Delta z_{n}\right)=-q_{n} x_{n+1-l}^{\beta} \leq 0, n \geq n_{1} \tag{7}
\end{equation*}
$$

In view of condition (4), it is easy to see that $\Delta z_{n}>0$ for all $n \geq n_{1}$. Now, it follows from the definition of $z_{n}$, and using $z_{n} \geq M>0$ for all $n \geq n_{1}$, we have

$$
\begin{equation*}
x_{n}=z_{n}-p_{n} x_{n-k}^{\alpha} \geq\left(z_{n}^{1-\alpha}-p_{n}\right) z_{n}^{\alpha} \geq\left(M^{1-\alpha}-p_{n}\right) z_{n}^{\alpha}, n \geq n_{1} \tag{8}
\end{equation*}
$$

From (7) and (8), we have

$$
\begin{equation*}
\Delta\left(a_{n} \Delta z_{n}\right)+q_{n}\left(M^{1-\alpha}-p_{n+1-l}\right)^{\beta} z_{n+1-l}^{\alpha \beta} \leq 0, n \geq n_{1} \tag{9}
\end{equation*}
$$

Summing equation (9) from $n_{1}$ to $n$ and using $z_{n} \geq M$, the last inequality yields

$$
M^{\alpha \beta} \sum_{s=n_{1}}^{n} q_{s}\left(M^{1-\alpha}-p_{s+1-l}\right)^{\beta}<\infty
$$

which contradicts (6) as $n \rightarrow \infty$. This completes the proof of the theorem.
In the next theorem, we reduce the oscillation of equation (1) to that of a first order delay difference equation. Define

$$
R_{n}=\sum_{s=n_{0}}^{n-1} \frac{1}{a_{s}}
$$

Theorem 2: Assume that $\left(H_{1}\right)-\left(H_{4}\right)$ and (4) hold. If the first order delay difference equation

$$
\begin{equation*}
\Delta w_{n}+q_{n}\left(M^{1-\alpha}-p_{n+1-l}\right)^{\beta} R_{n+1-l}^{\alpha \beta} w_{n+1-l}^{\alpha \beta}=0 \tag{10}
\end{equation*}
$$

is oscillatory, then every solution of equation (1) is oscillatory.
Proof: Assume to the contrary that equation (1) has an eventually positive solution $\left\{x_{n}\right\}$, say $x_{n}>0, x_{n-k}>0$, and $x_{n-l}>0$ for all $n \geq n_{1}$ for some $n_{1} \geq n_{0}$. Proceeding as in proof of Theorem 1 we obtain (9).

## B. Kamaraj ${ }^{1^{*}}$ and R. Vasuki ${ }^{2}$ /

Now

$$
\begin{equation*}
z_{n}=z_{n_{1}}+\sum_{s=n_{1}}^{n-1} \frac{a_{s} \Delta z_{s}}{a_{s}} \geq a_{n} \Delta z_{n} R_{n}, \quad n \geq n_{1} \tag{11}
\end{equation*}
$$

where we have used $\left\{a_{n} \Delta z_{n}\right\}$ is positive and decreasing for all $n \geq n_{1}$. Combining (9) and (11), we obtain

$$
\Delta\left(a_{n} \Delta z_{n}\right)+q_{n}\left(M^{1-\alpha}-p_{n+1-l}\right)^{\beta} R_{n+1-l}^{\alpha \beta}\left(a_{n+1-l} \Delta z_{n+1-l}\right)^{\alpha \beta} \leq 0, n \geq n_{1}
$$

Set $w_{n}=a_{n} \Delta z_{n}$. Then $\left\{w_{n}\right\}$ is a positive solution of the inequality

$$
\Delta w_{n}+q_{n}\left(M^{1-\alpha}-p_{n+1-l}\right)^{\beta} R_{n+1-l}^{\alpha \beta} w_{n+1-l}^{\alpha \beta} \leq 0
$$

It follows from Lemma 2.7 of [7], the corresponding difference equation (10) also has a positive solution, which is a contradiction. The proof is now completed.

Remark 1: Employing sufficient conditions for oscillation of equation (10), one can obtain easily verifiable criteria for the oscillation of all solutions of equation (1).

Corollary 3: Assume that $\left(H_{1}\right)-\left(H_{4}\right)$ and (4) hold. If $\alpha \beta=1, l \geq 2$, and

$$
\begin{equation*}
\lim _{n \rightarrow \infty} \inf \sum_{s=n-l+1}^{n-1} q_{s}\left(M^{1-\alpha}-p_{s+1-l}\right)^{\beta} R_{s+1-l}>\left(\frac{l-1}{l}\right)^{l} \tag{12}
\end{equation*}
$$

then every solution of equation (1) is oscillatory.
Proof: Condition (12) and Theorem 7.5.1 of [3] implies oscillation of equation (10). The assertion now follows from Theorem 2. This completes the proof.

Corollary 4: Assume that $\left(H_{1}\right)-\left(H_{4}\right)$ and (4) hold. If $\alpha \beta<1$, and

$$
\sum_{n=n_{1}}^{\infty} q_{n}\left(M^{1-\alpha}-p_{n+1-l}\right)^{\alpha} R_{n+1-l}^{\alpha \beta}=\infty
$$

then every solution of equation (1) is oscillatory.
Proof: Condition (13) and Theorem 1 of [4] implies oscillation of equation (10). The assertion now follows from Theorem 2. The proof is now completed.

Corollary 5: Assume that $\left(H_{1}\right)-\left(H_{4}\right)$ and [4] hold. If $\alpha \beta>1, l \geq 2$, and there exists a $\lambda>\frac{1}{l-1} \log \alpha \beta$ such that

$$
\lim _{\mathrm{n} \rightarrow \infty}\left[q_{n}\left(M^{1-\alpha}-p_{n+1-l}\right)^{\beta} R_{n+1-l}^{\alpha \beta} \exp \left(-e^{\lambda_{n}}\right)\right)>0
$$

then every solution of equation (1) is oscillatory.
Proof: Condition (14) and Theorem 2 of [4] implies oscillation of equation (10). The conclusion now follows from Theorem 2, and the proof is completed.

Our next results are for the case where (5) holds in place of (4). We let

$$
A_{n}=\sum_{s=n}^{\infty} \frac{1}{a_{s}}
$$

We will also need the condition

$$
E_{n}=\frac{K^{1-\alpha}}{A_{n}^{1-\alpha}}\left(1-\frac{p_{n} A_{n-k}^{\alpha}}{K^{1-\alpha} A_{n}}\right)>0
$$

for all constant $\mathrm{K}>0$ and all $n \geq n_{1} \geq n_{0}$.
Theorem 6: Let $\alpha \beta \geq 1$ and $\left(H_{1}\right)-\left(H_{4}\right)$, (5) and (15) hold. If there exists a positive nondecreasing real sequence $\left\{\rho_{n}\right\}$ such that

$$
\begin{equation*}
\lim _{\mathrm{n} \rightarrow \infty} \sup \sum_{s=n_{1}}^{n}\left[\rho_{s} q_{s}\left(M^{1-\alpha}-p_{s+1-l}\right)^{\beta}-\frac{a_{s-l}\left(\Delta \rho_{s}\right)^{2}}{4 \alpha \beta \rho_{s}}\right]=\infty, \tag{16}
\end{equation*}
$$

and

$$
\begin{equation*}
\lim _{\mathrm{n} \rightarrow \infty} \sup \sum_{s=n_{1}}^{n}\left[\rho_{s} q_{s}\left(M^{1-\alpha}-p_{s+1-l}\right)^{\beta}-\frac{a_{s-l}\left(\Delta \rho_{s}\right)^{2}}{4 \alpha \beta \rho_{s}}\right]=\infty \tag{17}
\end{equation*}
$$

hold for all constants $M>0$ and $K>0$, then every solution of equation (1) is oscillatory.

## B. Kamaraj $^{1^{*}}$ and R. Vasuki ${ }^{2}$ /

## Oscillation Criteria for Second Order Difference Equations with Nonlinear Neutral Term / IJMA- 9(8), August-2018.

Proof: Assume to the contrary that equation (1) has an eventually positive solution such that $x_{n}>0, x_{n-k}>0$, and $x_{n-l}>0$ for all $n \geq n_{1} \geq n_{0}$. From equation (1) that (7) holds, we then have either $\Delta z_{n}>0$ or $\Delta z_{n}<0$ eventually. If $\Delta z_{n}>0$ holds, then we can proceed as in the proof of Theorem 1, we obtain (9). Define

$$
\begin{equation*}
w_{n}=\rho_{n} \frac{a_{n} \Delta z_{n}}{z_{n-l}^{\alpha \beta}}, n \geq n_{1} . \tag{18}
\end{equation*}
$$

Then $w_{n}>0$ for $n \geq n_{1}$, and from (18) and (19), we obtain

$$
\begin{equation*}
\Delta w_{n} \leq-\rho_{n} q_{n}\left(M^{1-\alpha}-p_{n+1-l}\right)^{\beta}+\frac{\Delta \rho_{n}}{\rho_{n+1}} w_{n+1}-\frac{\rho_{n}}{\rho_{n+1}} w_{n+1} \frac{\Delta z_{n-l}^{\alpha \beta}}{z_{n-l}^{\alpha \beta}} \tag{19}
\end{equation*}
$$

By Mean value theorem, we have

$$
\Delta z_{n-l}^{\alpha \beta} \leq \alpha \beta z_{n+1-l}^{\alpha \beta-1} \Delta z_{n-l}
$$

and from (19), we obtain

$$
\begin{equation*}
\Delta w_{n} \leq-\rho_{n} q_{n}\left(M^{1-\alpha}-p_{n+1-l}\right)^{\beta}+\frac{\Delta \rho_{n+1}}{\rho_{n+1}} w_{n+1}-\alpha \beta \frac{\rho_{n}}{\rho_{n+1}^{2} a_{n-l}} w_{n+1}^{2} \tag{20}
\end{equation*}
$$

for $n \geq n_{1}$, where we have used $a_{n} \Delta z_{n}$ is decreasing and $z_{n}$ is increasing. Using the completing square in (20), and then summing the resulting inequality from $n_{1}$ to $n$, we obtain

$$
\sum_{s=n_{1}}^{n}\left[\rho_{s} q_{s}\left(M^{1-\alpha}-p_{s+1-l}\right)^{\beta}-\frac{a_{s-l}\left(\Delta \rho_{s}\right)^{2}}{4 \alpha \beta \rho_{s}}\right] \leq w_{n_{1}}
$$

which contradicts (16) as $n \rightarrow \infty$.
Next assume that $\Delta z_{n}<0$ for all $n \geq n_{1}$. Define

$$
\begin{equation*}
u_{n}=\frac{a_{n} \Delta z_{n}}{z_{n}^{\alpha \beta}}, n \geq n_{1} \tag{21}
\end{equation*}
$$

Thus $u_{n}<0$ for all $n \geq n_{1}$ and from (7) we have

$$
\Delta z_{s} \leq \frac{a_{n} \Delta z_{n}}{a_{s}}, s \geq n
$$

Summing the last inequality from $n$ to $j$, we obtain

$$
z_{j+1}-z_{n} \leq a_{n} \Delta z_{n} \sum_{s=n}^{j} \frac{1}{a_{s}}
$$

and then letting $j \rightarrow \infty$ gives

$$
\begin{equation*}
\frac{a_{n} \Delta z_{n} A_{n}}{z_{n}} \geq-1, n \geq n_{1} \tag{22}
\end{equation*}
$$

Thus $-\frac{a_{n} \Delta z_{n}\left(-a_{n} \Delta z_{n}\right)^{\alpha \beta-1} A_{n}^{\alpha \beta}}{z_{n}^{\alpha \beta}} \leq 1$ for $n \geq n_{1}$. Since $-a_{n} \Delta z_{n}>0$ and (7) and (21) hold, we have

$$
\begin{equation*}
-\frac{1}{L^{\alpha \beta-1}} \leq u_{n} A_{n}^{\alpha \beta} \leq 0 \tag{23}
\end{equation*}
$$

where $L=-a_{n_{1}} \Delta z_{n_{1}}$. On the other hand from (22),

$$
\begin{equation*}
\Delta\left(\frac{z_{n}}{A_{n}}\right) \geq 0, n \geq n_{1} \tag{24}
\end{equation*}
$$

From the definition of $z_{n}$ and (24), we have

$$
\begin{align*}
x_{n}=z_{n}-p_{n} x_{n-k}^{\alpha} \geq z_{n}-p_{n} z_{n-k}^{\alpha} & \geq z_{n}-p_{n} \frac{A_{n-k}^{\alpha}}{A_{n}^{\alpha}} z_{n}^{\alpha} \\
& \geq\left(K^{1-\alpha} A_{n}^{1-\alpha}-\frac{p_{n} A_{n-k}^{\alpha}}{A_{n}^{\alpha}}\right) z_{n}^{\alpha}, n \geq n_{1} \tag{25}
\end{align*}
$$

where we have used $\frac{z_{n}}{A_{n}} \geq K>0$ for all $n \geq n_{1}$. From (7) and (25), we obtain

$$
\Delta\left(a_{n} \Delta z_{n}\right) \leq-q_{n} E_{n+1-l}^{\beta} z_{n+1-l}^{\alpha \beta}, n \geq n_{1}
$$

From (18), we have

$$
\Delta u_{n}=\frac{\Delta\left(a_{n} \Delta z_{n}\right)}{z_{n+1}^{\alpha \beta}}-\frac{a_{n} \Delta z_{n}}{z_{n}^{\alpha \beta} z_{n+1}^{\alpha \beta}} \Delta z_{n}^{\alpha \beta}, n \geq n_{1}
$$

## B. Kamaraj $^{1^{*}}$ and R. Vasuki ${ }^{2}$ /

By Mean value theorem

$$
\Delta z_{n}^{\alpha \beta}=\left\{\begin{array}{c}
\alpha \beta z_{n+1}^{\alpha \beta-1} \Delta z_{n}, \text { if } \alpha \beta>1  \tag{28}\\
\alpha \beta z_{n}^{\alpha \beta-1} \Delta z_{n}, \quad \text { if } \alpha \beta<1,
\end{array}\right.
$$

So combining (28) and (27) and then using the fact that $\Delta z_{n}<0$ gives

$$
\begin{align*}
\Delta u_{n} & \leq \frac{\Delta\left(a_{n} \Delta z_{n}\right)}{z_{n+1}^{\alpha \beta}}-\alpha \beta \frac{u_{n}^{2}}{a_{n}} z_{n}^{\alpha \beta-1} \\
& \leq-q_{n} E_{n+1-l}^{\alpha}-\alpha \beta K^{\alpha \beta-1} A_{n}^{\alpha \beta-1} \frac{u_{n}^{2}}{a_{n}}, n \geq n_{1} \tag{29}
\end{align*}
$$

where we have used $\frac{z_{n+1-l}}{z_{n+1}} \geq 1$ for all $n \geq n_{1}$. Multiplying (29) by $A_{n+1}^{\alpha \beta}$, and then summing it from $n_{1}$ to $n-1$, we have

$$
\begin{equation*}
\sum_{s=n_{1}}^{n-1} A_{s+1}^{\alpha \beta} \Delta u_{s}+\sum_{s=n_{1}}^{n-1} A_{s+1}^{\alpha \beta} q_{s} E_{s+1-l}^{\beta}+\sum_{s=n_{1}}^{n-1} \alpha \beta K^{\alpha \beta-1} A_{s}^{\alpha \beta-1} A_{s+1}^{\alpha \beta} \frac{u_{n}^{2}}{a_{n}} \leq 0 \tag{30}
\end{equation*}
$$

By summation by parts formula and Mean value theorem, we obtain

$$
\begin{equation*}
\sum_{s=n_{1}}^{n-1} A_{s+1}^{\alpha \beta} \Delta u_{s} \geq A_{n}^{\alpha \beta} u_{n}-A_{n_{1}}^{\alpha \beta} u_{n_{1}}+\sum_{s=n_{1}}^{n-1} \frac{\alpha \beta u_{s} A_{s}^{\alpha \beta-1}}{a_{s}} \tag{31}
\end{equation*}
$$

From (31) and (30), we obtain

$$
\begin{aligned}
& A_{n}^{\alpha \beta} u_{n}-A_{n_{1}}^{\alpha \beta} u_{n_{1}}+\sum_{s=n_{1}}^{n-1} \frac{\alpha \beta u_{s} A_{s}^{\alpha \beta-1}}{a_{s}}+\sum_{\substack{s=n_{1}}}^{n-1} \alpha \beta K^{\alpha \beta-1} A_{s}^{\alpha \beta-1} A_{s+1}^{\alpha \beta} \frac{u_{n}^{2}}{a_{n}} \\
& +\sum_{s=n_{1}}^{n-1} A_{s+1}^{\alpha \beta} q_{s} E_{s+1-l}^{\beta} \leq 0 \\
& \sum_{s=n_{1}}^{n-1}\left[A_{s+1}^{\alpha \beta} q_{s} E_{s+1-l}^{\beta}-\frac{\alpha \beta K^{1-\alpha \beta} A_{s}^{\alpha \beta-1}}{4 a_{s} A_{s+1}^{\alpha \beta}}\right] \leq \frac{1}{L^{\beta-1}}+A_{n_{1}}^{\alpha \beta} u_{n_{1}}
\end{aligned}
$$

when using (23). This contradicts (17) as $n \rightarrow \infty$, and the proof is now completed.
Corollary 7: Let $\alpha \beta>1$ and $\left(H_{1}\right)-\left(H_{4}\right)$, (5) and (15) hold. If condition (17) and $l \geq 2$ hold, and there exists a $\lambda>\frac{1}{l-1} \log \alpha \beta$ such that (14) holds then every solution of equation (1) is oscillatory.

Proof: The proof follows from Corollary 5 and Theorem 6. This completes the proof.
Theorem 8: Let $0<\alpha \beta<1$ and $\left(H_{1}\right)-\left(H_{4}\right)$, (5) and (15) hold. If condition (13) holds, and

$$
\begin{equation*}
\lim _{n \rightarrow \infty} \sup \sum_{s=n_{0}}^{n-1}\left[K^{\alpha \beta-1} A_{s+1} q_{s} E_{s+1-l}^{\beta}-\frac{1}{4 a_{s} A_{s+1}}\right]=\infty \tag{32}
\end{equation*}
$$

for all constant $K>0$, then every solution of equation (1) is oscillatory.
Proof: Proceeding as in the proof of Theorem 6, we see that $\Delta z_{n}>0$ or $\Delta z_{n}<0$ eventually. If $\Delta z_{n}>0$ for all $n \geq n_{1}$ then by Corollary 4, we obtain a contradiction to (13). Next we assume that $\Delta z_{n}<0$ for all $n \geq n_{1}$. Proceeding as in the proof of Theorem 6 we obtain (26). Define

$$
\begin{equation*}
u_{n}=\frac{a_{n} \Delta z_{n}}{z_{n}}, n \geq n_{1} \tag{33}
\end{equation*}
$$

Thus $u_{n}<0$ for all $n \geq n_{1}$.
From (33) and (26), we see that

$$
\begin{equation*}
\Delta u_{n} \leq-q_{n} E_{n+1-l}^{\beta} \frac{z_{n+1-l}^{\alpha \beta}}{z_{n+1}}-\frac{u_{n}^{2}}{a_{n}}, n \geq n_{1} \tag{34}
\end{equation*}
$$

Since $\left\{z_{n}\right\}$ is positive and decreasing there exists a constant $K>0$ such that $z_{n} \leq K$ for all $n \geq n \geq 1$. Using the last inequality in (34), we obtain

$$
\Delta u_{n} \leq-q_{n} \frac{E_{n+1-l}^{\beta}}{K^{1-\alpha \beta}}-\frac{u_{n}^{2}}{a_{n}}, n \geq n_{1}
$$

## B. Kamaraj ${ }^{1^{*}}$ and R. Vasuki ${ }^{2} /$

Oscillation Criteria for Second Order Difference Equations with Nonlinear Neutral Term / IJMA- 9(8), August-2018.
Multiplying the last inequality $A_{n+1}$ and then summing it from $n_{1}$ to $n-1$, we have

$$
A_{n} u_{n}-A_{n_{1}} u_{n_{1}}+\sum_{s=n_{1}}^{n-1} K^{\alpha \beta-1} A_{s+1} q_{s} E_{s+1-l}^{\beta}+\sum_{s=n_{1}}^{n-1}\left(\frac{u_{s}}{a_{s}}+A_{s+1} \frac{u_{s}^{2}}{a_{s}}\right) \leq 0
$$

which on using completing the square yields

$$
\sum_{s=n_{1}}^{n-1}\left[K^{\alpha \beta-1} A_{s+1} q_{s} E_{s+1-l}^{\beta}-\frac{1}{4 a_{s} A_{s+1}}\right] \leq 1+A_{n_{1}} u_{n_{1}}
$$

when using (22). This contradicts (32) as $n \rightarrow \infty$, and the proof is now complete.

## EXAMPLES

In this section, we present some examples to illustrate our main results.
Example 1: Consider the neutral difference equation

$$
\begin{equation*}
\Delta\left(\frac{1}{2 n+1} \Delta\left(x_{n}+\frac{1}{n} x_{n-1}^{\frac{1}{3}}\right)\right)+\left(\frac{4(n+1)}{(2 n+1)(2 n+3)}+\frac{2}{n(n+2)}\right) x_{n-1}^{3}=0, n \geq 1 \tag{35}
\end{equation*}
$$

Here $a_{n}=\frac{1}{2 n+1}, \quad p_{n}=\frac{1}{n}, q_{n}=\frac{4(n+1)}{(2 n+1)(2 n+3)}+\frac{2}{n(n+2)}, \alpha=\frac{1}{3}, \beta=3, k=2$ and $l=2$. Simple calculation shows that $R_{n}=n^{2}-1$ and we see that all conditions of Corollary 3 are satisfied. Hence every solution of equation (35) is oscillatory, and in fact $\left\{x_{n}\right\}=\left\{(-1)^{3 n}\right\}$ is are such oscillatory solution of equation (35).

Example 2:.Consider the neutral difference equation

$$
\begin{equation*}
\Delta\left(n \Delta\left(x_{n}+\frac{1}{n} x_{n-2}^{\frac{1}{3}}\right)\right)+\frac{1}{n} x_{n-1}^{\frac{1}{5}}=0, n \geq 1 \tag{36}
\end{equation*}
$$

Here $a_{n}=n, p_{n}=\frac{1}{n}, q_{n}=\frac{1}{n}, \alpha=\frac{1}{3}, \beta=\frac{1}{5}, k=1$ and $l=2$. It is easy to see that all conditions of Corollary 4 are satisfied, and hence every solution of equation (36) is oscillatory.

Example 3: Consider the neutral difference equation

$$
\begin{equation*}
\Delta\left((n+1)(n+2) \Delta\left(x_{n}+\frac{1}{n(n+1)} x_{n-1}^{\frac{1}{3}}\right)\right)+4(n+2)^{2} x_{n-1}^{3}=0, n \geq 1 \tag{37}
\end{equation*}
$$

Here $a_{n}=(n+1)(n+2), p_{n}=\frac{1}{n(n+1)}, q_{n}=4(n+2)^{2}, \alpha=\frac{1}{3}, \beta=3, k=1$ and $l=2$.
Simple calculation shows that $A_{n}=\frac{1}{n}+1, \alpha \beta=1$ and $K^{\frac{2}{3}}(n+1)^{\frac{2}{3}}\left(1-\frac{K^{-\frac{2}{3}}}{n^{\frac{4}{3}}}\right)>0$. The conditions (16) and (17) are also satisfied with $\rho_{n}=1$. Therefore by Theorem 8 , every solution of equation (37) is oscillatory.

We conclude this paper with the following remark.
Remark 3.4: In this paper, we obtain oscillation criteria for equation (1) by employing comparison method and Riccati type transformation involving both $\alpha$ and $\beta$. Therefore the results presented in this paper are new and complement to the existing results reported in the literature. Further condition (15) is some what restrictive and it implies that we must have $\left\{p_{n}\right\} \rightarrow 0$ as $n \rightarrow \infty$. It would be good to obtain a result that did not require this added condition.
