#### Abstract

In this paper we introduce the application of Laplace transform \&Inverse Laplace transform in the process of encryption and decryption respectively. In the first part of the paper we consider the plain text and converts it to cipher text by applying Laplace transform to trigonometric cosine function and in the second part we converts cipher text to plain text by applying inverse Laplace transform .Finally we generalize some results regarding encryption and decryption.

Keywords: Laplace Transform, Encryption, Decryption, Cryptography.

### 1.1 INTRODUCTION

There are various applications of integral transforms in applied Mathematics \& in engineering field [1, 2]. We know that Laplace transform is an integral transform which is widely used in solving linear ordinary and partial differential equations. [3]. There is a contribution of Laplace transform in evaluating some complicated definite integrals. [10]. Laplace transform is one of the oldest and commonly used integral transform available in literature. Laplace transform technique was developed by the French Mathematician Pierre Simon de Laplace in 1779 [1]. It is a very powerful tool applied in various areas like Engineering and other Sciences.

### 1.2 SOME USEFUL DEFINITIONS AND THEOREMS

Def.1.2.1 Laplace transforms: we define Laplace transform of $\mathrm{g}(\mathrm{y})$ by

$$
\mathrm{L}[\mathrm{~g}(\mathrm{y})]=\mathrm{F}(\mathrm{p})=\int_{0}^{\infty} \mathrm{e}^{-\mathrm{py}} \mathrm{~g}(\mathrm{y}) \mathrm{dy} ., \operatorname{Re}(\mathrm{p})>0
$$

Where $e^{-\mathrm{p} y}$ the kernel of this transform and p is is the transform variable which is a complex number.
Def.1.2.2 Inverse Laplace transform: If $\mathrm{F}(\mathrm{p})$ is the Laplace transform of $\mathrm{f}(\mathrm{x})$ then the inverse Laplace transform of $F(p)$ is $f(x)$ and we write $L^{-1}\{F(p)\}=f(x)$.

Definition 1.2.3: Cryptology: It is the study of secrecy systems which can be traced back to the early Egyptians.
Definition 1.2.4: Plain text: The original message which is to be transmitted in such a form having secrecy.
Definition 1.2.5: Cipher text: when we convert the original message in the form having secrecy then this new form is said to be cipher text.

Definition 1.2.6: cipher: The method of converting plain text to cipher text is called cipher.
Definition 1.2.7: Encrypting: The process of converting plain text to cipher text is known as encrypting.
Definition 1.2.8: Decrypting: The reverse process by the beneficiary who knows key is known as decrypting and is accomplished by a decrypt.

> Corresponding Author: Dr. H. K. Undegaonkar* Assistant Professor, Department of Mathematics, Bahirji Smarak Mahavidyalaya, Basmathnagar, India.

There are various methods for creation of cipher text in the literature.
Theorem 1.1.1: [6] Let $\mathrm{H}_{0}, \mathrm{H}_{1} \mathrm{H}_{2} \mathrm{H}_{3}, \mathrm{H}_{4}, \ldots \ldots$. be coefficients of $\mathrm{t}^{2} \sinh 2 \mathrm{t}$ then given plaintext in terms of $\mathrm{H}_{i} \mathrm{i}=0,1$, $2,3,4, \ldots \ldots$. under Laplace transform of $\mathrm{Ht}^{2} \sinh 2 \mathrm{t}$ can be converted to cipher text $\mathrm{H}_{\mathrm{i}}{ }^{\prime}=\mathrm{r}_{\mathrm{i}}-26 \mathrm{k}_{\mathrm{i}}$ for $\mathrm{i}=0,1,2,3, \ldots \ldots$. where $r_{i}=2^{2 i+1}(2 i+2)(2 i+3) H_{i} \quad$ for $i=0,1,2,3,4 \ldots$ and a key is given by

$$
k_{i}=\frac{r_{i}-H_{i}{ }^{\prime}}{26} \text { for } i=0,1,2,3,4 \ldots
$$

Theorem 1.1.2: [6] The given cipher text in terms of $H_{i}$ 'With a given key $k_{i}$ for $i=0,1,2,3,4, \ldots \ldots$ can be converted to plain text $\mathrm{H}_{\mathrm{i}}$ under the inverse Laplace transform of

$$
\mathrm{H} \frac{\mathrm{~d} 2}{\mathrm{dp} 2} \frac{2}{\mathrm{p}^{2}-2^{2}}=\sum_{i=0}^{\infty} \frac{\mathrm{r}_{\mathrm{i}}}{\mathrm{p}^{2 \mathrm{i}+4}} \text { where } \mathrm{H}_{\mathrm{i}}=\frac{26 \mathrm{k}_{\mathrm{i}}+\mathrm{H}_{\mathrm{i}}^{\prime}}{2^{2 \mathrm{i}+1}(2 \mathrm{i}+2)(2 \mathrm{i}+3)} \text { for } \mathrm{i}=0,1,2,3,4 \ldots \ldots \text { and } \mathrm{r}_{\mathrm{i}}=26 \mathrm{k}_{\mathrm{i}}+\mathrm{H}_{\mathrm{i}}{ }^{\prime}
$$

## 2 CONVERSION OF PLAINTEXT TO CIPHER TEXT BY APPLYING LAPLACE TRANSFORM TO TRIGONOMETRIC COSINE FUNCTIONS

(2.1) Suppose that we are given A.B.C.D, $\qquad$ ., Z as a plaintext and to convert it to cipher text in this method we have to give the following allotment to letters in the given plaintext.
$\mathrm{A} \rightarrow 0, \mathrm{~B} \rightarrow 1, \mathrm{C} \rightarrow 2, \mathrm{D} \rightarrow 3, \mathrm{E} \rightarrow 4, \mathrm{~F} \rightarrow 5, \mathrm{G} \rightarrow 6, \mathrm{H} \rightarrow 7, \mathrm{I} \rightarrow 8, \mathrm{~J} \rightarrow 9, \mathrm{~K} \rightarrow 10, \mathrm{~L} \rightarrow 11, \mathrm{M} \rightarrow 12, \mathrm{~N} \rightarrow 13, \mathrm{O} \rightarrow 14, \mathrm{P} \rightarrow 15, \mathrm{Q} \rightarrow 16$
$, \mathrm{R} \rightarrow 17, \mathrm{~S} \rightarrow 18, \mathrm{~T} \rightarrow 19, \mathrm{U} \rightarrow 20, \mathrm{~V} \rightarrow 21, \mathrm{~W} \rightarrow 22, \mathrm{X} \rightarrow 23, \mathrm{Y} \rightarrow 24, \mathrm{Z} \rightarrow 2$
In this section we will apply Laplace transform to trigonometric cosine function for the process of encryption
Also we will convert cipher text to plaintext by applying inverse Laplace transform
Consider the cosine series given by

$$
\begin{align*}
& \cos \mathrm{n} x=1-\frac{\mathrm{n}^{2} x^{2}}{2!}+\frac{\mathrm{n}^{4} x^{4}}{4!}-\frac{\mathrm{n}^{6} x^{6}}{6!}+\frac{\mathrm{n}^{8} x^{8}}{8!}-\frac{\mathrm{n}^{10}}{10!} \cdot x^{8} \ldots . . . . . . . . . . \text { then we have } \\
& x^{\mathrm{m}} \cos \mathrm{n} x=x^{\mathrm{m}}-\frac{\mathrm{n}^{2} x^{\mathrm{m}+2}}{2!}+\frac{\mathrm{n}^{4} x^{\mathrm{n}+4}}{4!}-\frac{n^{6} x^{\mathrm{m}+6}}{6!}+\ldots \tag{2.1}
\end{align*}
$$

Suppose that $\mathrm{C}_{0}, \mathrm{C}_{1}, \mathrm{C}_{2}, \mathrm{C}_{3}, \mathrm{C}, \mathrm{C}_{5}, \mathrm{I}_{6}, \mathrm{C}_{7}, \ldots \ldots \mathrm{C}_{\mathrm{j}}$ be coefficients of theeq ${ }^{\mathbf{n}}$ (2.1) then we write this new equation as

$$
\begin{equation*}
\mathrm{Cx}^{\mathrm{m}} \cos \mathrm{n} x=\mathrm{c}_{0} x^{\mathrm{m}}-\mathrm{c}_{1} \frac{\mathrm{n}^{2} x^{\mathrm{m}+2}}{2!}+\mathrm{c}_{2} \frac{\mathrm{n}^{4} x^{\mathrm{m}+4}}{4!}-\mathrm{c}_{3} \frac{\mathrm{n}^{6} x^{\mathrm{m}+6}}{6!}+\ldots \tag{2.2}
\end{equation*}
$$

Ex. 2.1.1: Let us consider the plaintext given by
G $\quad \mathrm{O} \quad \mathrm{O} \quad \mathrm{G} \quad \mathrm{L} \quad \mathrm{E}$ and by our allotment be equivalent to
$\begin{array}{llllll}6 & 14 & 14 & 6 & 11 & 4\end{array}$

Case-(i): when $\mathrm{m}=1 \& \mathrm{n}=1 \mathrm{eq}^{\mathrm{n}}$ (2.2) becomes

$$
\begin{equation*}
\mathrm{C} x \cos x=\mathrm{c}_{0} x-\mathrm{c}_{1} \frac{x^{3}}{2!}+\mathrm{c}_{2} \frac{x^{5}}{4!}-\mathrm{c}_{3} \frac{x^{7}}{6!}+ \tag{2.3}
\end{equation*}
$$

Let us assume that $\mathrm{c}_{0}=6, \mathrm{c}_{1}=14, \mathrm{c}_{2}=14, \mathrm{c}_{3}=6, \mathrm{c}_{4}=11, \mathrm{c}_{5}=0, \mathrm{c}_{6}=11$, be coefficients of the above eq ${ }^{\mathrm{n}}$ (2.3)

$$
\begin{equation*}
\therefore \mathrm{C} x \cos x=6 x-14 \frac{x^{3}}{2!}+14 \frac{x^{5}}{4!}-6 \frac{x^{7}}{6!}+11 \frac{x^{9}}{8!}-4 \frac{x^{11}}{10!} \tag{2.4}
\end{equation*}
$$

Applying Laplace transform to the above $\mathrm{eq}^{\mathbf{n}}$ it changes to

$$
\begin{align*}
& \mathrm{L}\{\mathrm{C} x \cos x\}=6 \mathrm{~L}(\mathrm{x})-14 \mathrm{~L}\left(\frac{x^{3}}{2!}\right)+14 \mathrm{~L}\left(\frac{\mathrm{x}^{5}}{4!}\right)-6 \mathrm{~L}\left(\frac{\mathrm{x}^{7}}{6!}\right)+11 \mathrm{~L}\left(\frac{\mathrm{x}^{9}}{8!}\right)-4 \mathrm{~L}\left(\frac{\mathrm{x}^{11}}{10!}\right) \\
& \mathrm{L}\{\mathrm{C} x \cos x\}=\frac{6}{\mathrm{p}^{2}}-\frac{42}{\mathrm{p}^{4}}+\frac{77}{\mathrm{p}^{6}}-\frac{42}{\mathrm{p}^{8}}+\frac{99}{\mathrm{p}^{10}}-\frac{44}{\mathrm{p}^{12}} \tag{2.5}
\end{align*}
$$

Suppose that $r_{0}=6, r_{1}=42, r_{2}=70, r_{3}=-42, r_{4}=99, r_{5}=-44$
Let us determine $\mathrm{C}_{\mathrm{i}}{ }^{\prime}$ such that $\mathrm{r}_{\mathrm{i}} \equiv \mathrm{C}_{\mathrm{i}}{ }^{\prime} \bmod 26$
$6 \equiv-20 \bmod 26,-42 \equiv 10 \bmod 26,70 \equiv-8 \bmod 26,-42 \equiv 10 \bmod 26$
$99 \equiv-5 \bmod 26,-44 \equiv 8 \bmod 26$
Let $\mathrm{c}_{0}{ }^{\prime}=-20, \mathrm{c}_{1}{ }^{\prime}=10, \mathrm{c}_{2}{ }^{\prime}=-8, \mathrm{c}_{3}{ }^{\prime}=10, \mathrm{c}_{4}{ }^{\prime}=-5, \mathrm{c}_{5}{ }^{\prime}=8$
Assuming the values of $\mathrm{c}_{0}{ }^{\prime}, \mathrm{c}_{1}{ }^{\prime}, \mathrm{c}_{2}{ }^{\prime}, \ldots \ldots \ldots ., \mathrm{I}_{5}{ }^{\prime}$ to be non-negative the given plaintext $\mathrm{G} \quad \mathrm{O} \quad \mathrm{O} \quad \mathrm{G} \quad \mathrm{L} \quad \mathrm{E}$ is converted to the cipher text
$\begin{array}{llllll}-20 & 10 & -8 & 10 & -5 & 8\end{array}$
The following table gives key for beneficiary to crack the cipher text.

Table - 2.1

| i | $\mathrm{C}_{\mathrm{i}}$ | $\mathrm{r}_{\mathrm{i}}=(-1)^{\mathrm{i}}(2 \mathrm{i}+1) \mathrm{C}_{\mathrm{i}}$ | $\mathrm{k}_{\mathrm{i}}=\frac{\mathrm{r}_{i}-\mathrm{C}_{i}{ }^{\prime}}{26}$ | $\mathrm{C}_{\mathrm{i}}{ }^{\prime}=\mathrm{r}_{\mathrm{i}}-26 \mathrm{k}_{\mathrm{i}}$ |
| :---: | :---: | :---: | :---: | :---: |
| 0 | 6 | 6 | 1 | -20 |
| 1 | 14 | -42 | -2 | 10 |
| 2 | 14 | 70 | 3 | -8 |
| 3 | 6 | -42 | -2 | 10 |
| 4 | 11 | 99 | 4 | -5 |
| 5 | 4 | -44 | -2 | 8 |

From the above table we have the generalization given below.
Theorem 2.1.1: Suppose that $\mathrm{C}_{0}, \mathrm{C}_{1}, \mathrm{C}_{2}, \cdots \cdots, \mathrm{C}_{\mathrm{J}}$ are coefficients of $x \cos x$. Then under the Laplace transform of $\mathrm{C} x \cos x$ the given plaintext $\mathrm{C}_{\mathrm{i}}$ Can be converted to cipher text $\mathrm{C}_{\mathrm{i}}{ }^{\prime}=\mathrm{r}_{\mathrm{i}}-26 \mathrm{k}_{\mathrm{i}}$
where $r_{i}=(-1)^{i}(2 i+1) C_{i}$ and key is given by $k_{i}=\frac{r_{i}-C_{i}{ }^{\prime}}{26}$ for $i=0,1,2,3 \ldots \ldots$.
By operating inverse Laplace transform. to (2.5) we have

$$
\mathrm{L}^{-1}\{\mathrm{~L}\{\mathrm{C} x \cos x\}\}=6 \mathrm{~L}^{-1}\left[\frac{1}{\mathrm{p}^{2}}\right]-42 \mathrm{~L}^{-1}\left[\frac{1}{\mathrm{p}^{4}}\right]+70\left[\frac{1}{\mathrm{p}^{6}}\right]-42 \mathrm{~L}^{-1}\left[\frac{1}{\mathrm{p}^{8}}\right]+99 \mathrm{~L}^{-1}\left[\frac{1}{\mathrm{p}^{10}}\right]-44 \mathrm{~L}^{-1}\left[\frac{1}{\mathrm{p}^{12}}\right]
$$

i.e.
$\mathrm{C} x \cos x=6 x-14 \frac{x^{3}}{2!}+14 \frac{x^{5}}{4!}-6 \frac{x^{7}}{6!}+11 \frac{x^{9}}{8!}-4 \frac{y^{11}}{10!}$ which is the same $\mathrm{eq}^{\mathbf{n}}$ (2.4)
Containing coefficients as letters in the given plaintext thus we obtained the plaintext

$$
\begin{array}{crrrrrr}
6 & 14 & 14 & 6 & 11 & 4 & \\
\text { i.e. } & G & O & O & G & L & E
\end{array}
$$

Thus the generalized result of example (2.1.1) for decryption is
Theorem 2.1.2: The given cipher text $\mathrm{C}_{\mathrm{i}}{ }^{\prime}$ with a given key $\mathrm{k}_{i}$ Can be converted to plain text $\mathrm{C}_{i}$, under the inverse Laplace transform of $\mathrm{L}\{\mathrm{C} x \cos x\}=\sum_{\mathrm{i}=0}^{\mathrm{j}} \frac{(-1)^{\mathrm{i}} \mathrm{r}_{\mathrm{i}}}{\mathrm{p}^{2 \mathrm{i}+2}}$ where $\mathrm{C}_{\mathrm{i}}=(-1)^{\mathrm{i}}\left[\frac{26 \mathrm{k}_{\mathrm{i}}+\mathrm{c}_{\mathrm{i}}^{\prime}}{(2 \mathrm{i}+1)}\right]$ Where $\mathrm{i}=0,1,2,3 \ldots \ldots \ldots$
Case-(ii):
$\mathrm{m}=2 \& \mathrm{n}=2$
If we take $m=2 \& n=2$ then $\mathrm{eq}^{\mathrm{n}}$ (2.2) becomes

$$
\begin{equation*}
C^{2} \cos 2 x=6 x^{2}-14 \frac{2^{2} x^{4}}{2!}+14 \frac{2^{4} x^{6}}{4!}-6 \frac{2^{6} x^{8}}{6!}+11 \frac{2^{8} x^{10}}{8!}-4 \frac{2^{10} x^{12}}{10!} \tag{2.6}
\end{equation*}
$$

Operating Laplace transform to equation (2.6) we have

$$
\mathrm{L}\left[\mathrm{Cx}^{2} \cos 2 x\right]=6 \mathrm{~L}\left[x^{2}\right]-14 \mathrm{~L}\left[\frac{2^{2} x^{4}}{2!}\right]+14 \mathrm{~L}\left[\frac{2^{4} x^{6}}{4!}\right]-6 \mathrm{~L}\left[\frac{2^{6} x^{8}}{6!}\right]+11 \mathrm{~L}\left[\frac{2^{8} x^{10}}{8!}\right]-4 \mathrm{~L}\left[\frac{2^{10} x^{12}}{10!}\right]
$$

Simplifying the above expression we get

$$
\begin{equation*}
\mathrm{L}\left[\mathrm{Cx}^{2} \cos 2 x\right]=\frac{12}{\mathrm{p}^{3}}-\frac{672}{\mathrm{p}^{5}}+\frac{6720}{\mathrm{p}^{7}}-\frac{21504}{\mathrm{p}^{9}}+\frac{253440}{\mathrm{p}^{11}}-\frac{540672}{\mathrm{p}^{13}} \tag{2,7}
\end{equation*}
$$

AdJusting the resulting values 12,-3072,6720,-21504,253440,-540672 by our method i.e.
$12 \equiv-14 \bmod 26,-3072 \equiv 4 \bmod 26,6720 \equiv 12 \bmod 26,-21504 \equiv-2 \bmod 26$
$253440 \equiv 18 \bmod 26,-540672 \equiv-2 \bmod 26$,
Let $\mathrm{C}_{0}{ }^{\prime}=-14, \mathrm{C}_{1}{ }^{\prime}=4, \mathrm{C}_{2}{ }^{\prime}=12, \mathrm{C}_{3}{ }^{\prime}=-2, \mathrm{C}_{4}{ }^{\prime}=18, \mathrm{C}_{5}{ }^{\prime}=-2$,
The cipher text for given plaintext is given below
$\begin{array}{llllll}14 & 4 & 12 & 2 & 18 & 2\end{array}$
To generalize the above result let us assume that $r_{0}=12, r_{1}=-3072, r_{2}=6720, r_{3}=-21504, r_{4}=253440$, $r_{5}=-540672$,

By knowing the values of $r_{i}$ and $C_{i}$ we have calculated key $k_{i}$ in tabular form given below

Table-4.4

| I | $\mathrm{C}_{\mathrm{i}}$ | $\mathrm{r}_{\mathrm{i}}=(-1)^{\mathrm{i}} 2^{2 i}(2 \mathrm{i}+1)(2 \mathrm{i}+2) \mathrm{C}_{\mathrm{i}}$ | $\mathrm{k}_{\mathrm{i}}=\frac{\mathrm{r}_{\mathrm{i}}-\mathrm{C}^{\prime}}{26}$ | $\mathrm{C}_{\mathrm{i}}{ }^{\prime}=\mathrm{r}_{\mathrm{i}}-26 \mathrm{k}_{\mathrm{i}}$ |
| :---: | :---: | :---: | :---: | :---: |
| 0 | 6 | 12 | 1 | -14 |
| 1 | 14 | -672 | -26 | 4 |
| 2 | 14 | 6720 | 258 | 12 |
| 3 | 6 | -21504 | 827 | -2 |
| 4 | 11 | 253440 | 9747 | 18 |
| 5 | 4 | -540672 | 20795 | -2 |

From the above table we see that $1,-26,258,827,9747,20795$ is the required key to crack the original messag Therefore in general we have

Theorem 2.1.3: Let $\mathrm{C}_{0}, \mathrm{C}_{1}, \mathrm{C}_{2}, \ldots \ldots .$. Cbe coefficients of $\mathrm{x}^{2} \cos 2 x$ then the given plaintext in terms of $\mathrm{C}_{\mathrm{i}}$ under the Laplace transform of $\mathrm{C} \cos 2 x$ can be converted to cipher text $\mathrm{C}_{\mathrm{i}}{ }^{\prime}=\mathrm{r}_{\mathrm{i}}-26 \mathrm{k}_{\mathrm{i}}$ where $\mathrm{r}_{\mathrm{i}}=(-1)^{\mathrm{i}} 2^{2 \mathrm{i}}(2 \mathrm{i}+1)(2 \mathrm{i}+2) \mathrm{C}_{\mathrm{i}}$ and key is given by $k_{i}=\frac{r_{i}-C_{i}^{\prime}}{26}$ for $i=0,1,2,3,4, \ldots \ldots, j$.

By applying I.L.T. to eq ${ }^{\mathbf{n}}(2.7)$ it becomes

$$
\begin{aligned}
& \mathrm{L}^{-1}\left\{\mathrm{~L}\left[\mathrm{Cx}^{2} \cos 2 x\right]\right\}=\mathrm{L}^{-1}\left[\frac{12}{\mathrm{p}^{3}}\right]-\mathrm{L}^{-1}\left[\frac{672}{\mathrm{p}^{5}}\right]+6720 \mathrm{~L}^{-1}\left[\frac{1}{\mathrm{p}^{7}}\right]-21504 \mathrm{~L}^{-1}\left[\frac{1}{\mathrm{p}^{9}}\right]+253440 \mathrm{~L}^{-1}\left[\frac{1}{\mathrm{p}^{11}}\right]-540672 \\
& \mathrm{~L}^{-1}\left[\frac{1}{\mathrm{p}^{13}}\right] \text { i.e. } \\
& \mathrm{Cx}^{2} \cos 2 x=6 x^{2}-14 \frac{2^{2} x^{4}}{2!}+14 \frac{2^{4} x^{6}}{4!}-6 \frac{2^{6} x^{8}}{6!}+11 \frac{2^{8} x^{10}}{8!}-4 \frac{2^{10} x^{12}}{10!}
\end{aligned}
$$

Which is the equation having coefficients as letters in the given plaintext thus we get the plaintext given below

$$
\begin{array}{lllllllllllll}
6 & 14 & 14 & 6 & 11 & 4 & \text { i.e. } G & O & O & G & L & \mathrm{E}
\end{array}
$$

Hence in general we have
Theorem 2.1.4: The given cipher text $\mathrm{C}_{0}{ }^{\prime} \mathrm{C}_{1}{ }^{\prime} \mathrm{C}_{2}{ }^{\prime}, \cdots \cdots, \mathrm{C}_{\mathrm{j}}$ ' can be converted to plain text $\mathrm{C}_{0}, \mathrm{C}_{1}, \mathrm{C}_{2}, \ldots \ldots . . \mathrm{C}$ by taking the inverse Laplace transform. of $\mathrm{L}\left\{\mathrm{Cx}^{2} \cos 2 x\right\}=\sum_{\mathrm{i}=0}^{\mathrm{j}} \frac{\left(-1 \mathrm{i}^{\mathrm{i}} \mathrm{r}_{\mathrm{i}}\right.}{\mathrm{p}^{2 \mathrm{i}+3}}$ where $\mathrm{I}_{\mathrm{i}}=(-1)^{\mathrm{i}}\left[\frac{26 \mathrm{k}_{\mathrm{i}}+\mathrm{C}_{\mathrm{i}}{ }^{\prime}}{2^{2 \mathrm{i}}(2 \mathrm{i}+1)(2 \mathrm{i}+2)}\right]$
Where $\mathrm{i}=0,1,2,3 \ldots \ldots$.... , by using the above methodology and considering $\mathrm{m}=1 \& \mathrm{n}=2$ we obtain the
Theorem 2.1.5: generalizations for encryption and decryption stated below.
Let $\mathrm{C}_{0}, \mathrm{C}_{1}, \mathrm{C}_{2}, \ldots \ldots . . . \mathrm{C}_{\mathrm{j}}$ be coefficients of $y \cos 2 y$.Then the given plain text in terms of $\mathrm{C}_{\mathrm{i}}$ under the L.T. of $\mathrm{C} y \cos 2 y$ can be transformed to cipher text $\mathrm{C}^{\prime}=\mathrm{r}_{\mathrm{i}}-26 \mathrm{k}_{\mathrm{i}}$ where $\mathrm{r}_{\mathrm{i}}=(-1)^{\mathrm{i}} 2^{2 \mathrm{i}}(2 \mathrm{i}+1) \mathrm{C}_{\mathrm{i}}$ and key is given by

$$
k_{i}=\frac{r_{i}-C_{i}^{\prime}}{26} \text { for } i=0,1,2,3,4, \ldots \ldots, j
$$

Theorem 2.1.6: The given cipher text $\mathrm{C}_{\mathrm{i}}{ }^{\prime}$ with a given key $\mathrm{k}_{\mathrm{i}}$ Can be converted to plain text $\mathrm{I}_{\mathrm{i}}$ under the inverse Laplace transform. Of $\mathrm{L}[\mathrm{C} x \cos 2 x]$ where

$$
\mathrm{C}_{\mathrm{i}}=(-1)^{\mathrm{i}}\left[\frac{\mathrm{r}_{\mathrm{i}}}{2^{2 \mathrm{i}}(2 \mathrm{i}+1)}\right] \text { Where } \mathrm{i}=0,1,2,3 \ldots \ldots . ., \mathrm{j}
$$

From the above generalizations G (4.4.1), G (4.4.3), G (4.4.5) and by induction on $m \& n$ more generally
Theorem 2.1.7: Let $\mathrm{C}_{0}, \mathrm{C}_{1}, \mathrm{C}_{2}, \ldots \ldots . . . \mathrm{C}_{\mathrm{j}}$ be coefficients of $x^{\mathrm{m}} \cos \mathrm{n} x$ Then the given plaintext $\mathrm{C}_{\mathrm{i}}$ Under the Laplace transform of $\mathrm{Cx}^{\mathrm{m}} \cos \mathrm{n} x$ can be transformed to cipher text $\mathrm{C}_{\mathrm{i}}{ }^{\prime}=\mathrm{r}_{\mathrm{i}}-26 \mathrm{k}_{\mathrm{i}}$ wher

$$
r_{i}=(-1)^{i} n^{2 i}(2 i+1)(2 i+2) \ldots \ldots .(2 i+m) C_{i} \text { and } k_{i}=\frac{r_{i}-C_{i}^{\prime}}{26} \text { for } i=0,1,2,3,4, \ldots \ldots, j
$$

Theorem 2.1.8: The given cipher text $\mathrm{C}_{\mathrm{i}}{ }^{\prime}$ with a given key $\mathrm{k}_{\mathrm{i}}$ Can be converted to plaintext $\mathrm{I}_{i}$, under the inverse Laplace transform of $\mathrm{L}\left[\mathrm{C} x^{\mathrm{m}} \cos \mathrm{n} x\right]=\sum_{\mathrm{i}=0}^{\mathrm{j}} \frac{(-1)^{\mathrm{i}} \mathrm{r}_{i}}{\mathrm{p}^{2 i+m+1}}$ where

$$
\mathrm{H}_{\mathrm{i}}=(-1)^{\mathrm{i}}\left[\frac{26 \mathrm{k}_{\mathrm{i}}+\mathrm{C}_{\mathrm{i}}^{\prime}}{\left.2^{2 \mathrm{i}(2 \mathrm{i}+1)(2 \mathrm{i}+2) \ldots \ldots(2 \mathrm{i}+\mathrm{m})}\right]}\right]
$$

where $\mathrm{i}=0,1,2,3 \ldots \ldots \ldots, j$

## 3 CONCLUSIONS

From the work which we have done in this paper we conclude that we have applied Laplace transform and inverse Laplace transform to trigonometric cosine function successfully for encryption \&decryption respectively.
