ABSTRACT

In this paper, we introduce $g^\#$ semi-closed sets in bitopological spaces. Properties of these sets are investigated and we introduce four new bitopological spaces namely, $(i,j)\text{-}T_b^\#$, $(i,j)\text{-}T_b^\#$, $(i,j)\text{-}T_b^{\#\#}$, $(i,j)\text{-}T_b^\#$ spaces as applications. Further, we introduce and study $(i,j)\text{-}g^\#s$ -continuous and $(i,j)\text{-}g^\#s$ -irresolute maps.

Keywords: $(i,j)\text{-}g^\#s$ -closed sets, $(i,j)\text{-}T_b^\#$, $(i,j)\text{-}T_b^\#$, $(i,j)\text{-}T_b^{\#\#}$, $(i,j)\text{-}T_b^\#$ spaces, $(i,j)\text{-}g^\#s$ -continuous and $(i,j)\text{-}g^\#s$ -irresolute maps.

1. Introduction:

A triple (X, τ_1, τ_2) where X is a nonempty set and τ_1 and τ_2 are topologies on X is called a bitopological space and Kelly initiated the study of such spaces. Levine introduced and studied semi-open sets¹ [11] and generalized closed sets²[10] in 1963 and 1970 respectively. S.P. Arya and T.Nour³ [3] defined generalized semi-closed sets (briefly g -closed sets) in 1990 for obtaining some characterizations of s -normal spaces. Njåstad⁴ [16] and Abd El-Monsef et. al⁵[1] introduced α -sets (called as α -closed sets) and semi-preopen sets respectively. Semi-preopen sets are also known as β -sets⁶ [2]. Maki et.al. Introduced generalized α -closed sets (briefly $g\alpha$ -closed sets)⁷[13] and α -generalized closed sets (briefly αg -closed sets)⁸[12] in 1993 and 1994 respectively. M.K.R.S. Veera Kumar introduced and studied $g^\#$ -semi-closed sets, $^\#T_b$ space, $T_b^\#$ space, $T_b^{\#\#}$ space and ${}_\alpha T_b^\#$ space, $g^\#s$ -continuous and $g^\#s$ -irresolute maps for general topology. The class of $g^\#$ -semi-closed sets is independent from the classes of g -closed sets, $g\alpha$ -closed sets, αg -closed sets and pre closed sets.

The purpose of this paper is to introduce the concepts of $g^\#$ -semi-closed sets, $^\#T_b$ space, $T_b^\#$ space, $T_b^{\#\#}$ space and ${}_\alpha T_b^\#$ space, $g^\#s$ -continuous and $g^\#s$ -irresolute maps for bitopological spaces and investigate some of their properties.

2. Prerequisites:

Throughout this paper (X, τ_1, τ_2) , (Y, σ_1, σ_2) and (Z, η_1, η_2) represent non-empty bitopological spaces on which no separation axioms are assumed unless otherwise mentioned. If A is a subset of X with topology τ then $cl(A)$, $int(A)$ and $C(A)$ denote the closure of A , the interior of A and the complement of A in X respectively. We recall the following definitions, which will be used often throughout this paper.

Definition 2.1: A subset A of a space (X, τ) is called

- (1) a preopen set if $A \subseteq int(cl(A))$ and a preclosed set if $cl(int(A)) \subseteq A$.
- (2) a semi-open set if $A \subseteq cl(int(A))$ and a semi-closed set if $int(cl(A)) \subseteq A$.
- (3) an α -open set if $A \subseteq int(cl(int(A)))$ and a α -closed set if $cl(int(cl(A))) \subseteq A$.
- (4) a semi-preopen set (= β -open) if $A \subseteq cl(int(cl(A)))$ and a semi-preclosed set (= β -closed) if $int(cl(int(A))) \subseteq A$.

The semi-closure (resp. α -closure) of a subset A of (X, τ) is denoted by $scl(A)$ (resp. $\alpha cl(A)$ and $spcl(A)$) and is the intersection of all semi-closed (resp. α -closed and semi-preclosed) sets containing A .

*Corresponding author: K. Reena**, *E-mail: reenamaths1@gmail.com

Definition 2.2: A subset A of a space (X, τ) is called

- (1) a generalized closed (briefly g -closed) set²[10] if $\text{cl}(A) \subseteq U$ whenever $A \subseteq U$ and U is open in (X, τ) .
- (2) a generalized semi-closed (briefly gs -closed) set³[3] if $\text{scl}(A) \subseteq U$ whenever $A \subseteq U$ and U is open in (X, τ) .
- (3) a generalized semi-preclosed (briefly gsp -closed) set¹²[9] if $\text{spcl}(A) \subseteq U$ whenever $A \subseteq U$ and U is open in (X, τ) .
- (4) an α -generalized closed (briefly αg -closed) set⁸[12] if $\alpha \text{cl}(A) \subseteq U$ whenever $A \subseteq U$ and U is open in (X, τ) .
- (5) a generalized α -closed (briefly $g\alpha$ -closed) set⁷[13] if $\alpha \text{cl}(A) \subseteq U$ whenever $A \subseteq U$ and U is α -open in (X, τ) .

Definition 2.3: A function $f: (X, \tau) \rightarrow (Y, \sigma)$ is called

- (1) *semi-continuous*¹ [11] if $f^{-1}(V)$ is semi-open in (X, τ) for every open set V of (Y, σ) .
- (2) *pre-continuous*¹¹ [14] if $f^{-1}(V)$ is pre-closed in (X, τ) for every closed set V of (Y, σ) .
- (3) *α -continuous*¹² [15] if $f^{-1}(V)$ is α -closed in (X, τ) for every closed set V of (Y, σ) .
- (4) *β -continuous*⁵ [1] if $f^{-1}(V)$ is semi-preopen in (X, τ) for every open set V of (Y, σ) .
- (5) *g -continuous*¹³ [4] if $f^{-1}(V)$ is g -closed in (X, τ) for every closed set V of (Y, σ) .
- (6) *gs -continuous*¹⁴ [7] if $f^{-1}(V)$ is gs -closed in (X, τ) for every closed set V of (Y, σ) .
- (7) *αg -continuous*² [10] if $f^{-1}(V)$ is αg -closed in (X, τ) for every closed set V of (Y, σ) .
- (8) *$g\alpha$ -continuous*⁷ [13] if $f^{-1}(V)$ is $g\alpha$ -closed in (X, τ) for every closed set V of (Y, σ) .
- (9) *gsp -continuous*¹⁶ [9] if $f^{-1}(V)$ is gsp -closed in (X, τ) for every closed set V of (Y, σ) .
- (10) *αg -irresolute*¹⁰ [6] if $f^{-1}(V)$ is αg -closed in (X, τ) for every αg -closed set V of (Y, σ) .
- (11) *pre-semi-open*¹⁵ [5] if $f(U)$ is semi-open in (Y, σ) for every semi-open set U in (X, τ) .

Definition 2.4: A topological space (X, τ) is said to be

- (1) a $T_{1/2}$ space if every g -closed set in it is closed.
- (2) a T_b space if every gs -closed set in it is closed.
- (3) an αT_b space if every αg -closed set in it is closed.

Definition 2.5: A subset A of a bitopological space (X, τ_1, τ_2) is called:

- (1) (i, j) - g -closed if $\tau_j\text{-cl}(A) \subseteq U$ whenever $A \subseteq U$ and U is open in τ_i
- (2) (i, j) - g^* -closed if $\tau_j\text{-cl}(A) \subseteq U$ whenever $A \subseteq U$ and U is g -open in τ_i
- (3) (i, j) - rg -closed if $\tau_j\text{-cl}(A) \subseteq U$ whenever $A \subseteq U$ and U is regular open in τ_i
- (4) (i, j) - gpr -closed if $\tau_j\text{-pcl}(A) \subseteq U$ whenever $A \subseteq U$ and U is regular open in τ_i

The family of all (i, j) - g -closed sets (resp. (i, j) - g^* -closed, (i, j) - rg -closed, (i, j) - gpr -closed) subsets of a bitopological space (X, τ_1, τ_2) is denoted by $D(i, j)$ (resp. $D^*(i, j)$, $D_r(i, j)$, $\xi(i, j)$).

Definition 2.6: A subset A of a bitopological space (X, τ_1, τ_2) is called:

- (1) (i, j) - $T_{1/2}$ space if every (i, j) - g -closed sets is τ_j -closed.
- (2) (i, j) - T_b space if every (i, j) - gs -closed set is τ_j -closed.
- (3) (i, j) - αT_b space if every (i, j) - αg -closed set is τ_j -closed.

Definition 2.7: A function $f: (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$ is called

- (1) τ_j -*semi-continuous*¹ [11] if $f^{-1}(V)$ is semi-open in (X, τ_1, τ_2) for every open set V of (Y, σ_1, σ_2) .
- (2) τ_j - *α -continuous*¹²[15] if $f^{-1}(V)$ is α -closed in (X, τ_1, τ_2) for every closed set V of (Y, σ_1, σ_2) .
- (3) τ_j - σ_k -continuous if $f^{-1}(V) \in \tau_j$, for every $V \in \sigma_k$.
- (4) (i, j) - *gs -continuous*¹⁴[7] if $f^{-1}(V)$ is gs -closed in (X, τ_1, τ_2) for every closed set V of (Y, σ_1, σ_2) .
- (5) (i, j) - *gsp -continuous*¹⁴[7] if $f^{-1}(V)$ is gsp -closed in (X, τ_1, τ_2) for every closed set V of (Y, σ_1, σ_2) .

3. $g^\#$ semi-closed sets in Bitopological spaces:

In this section we introduce the concept of $g^\#$ semi-closed sets in bitopological spaces and discuss the related properties.

Definition 3.1: A Subset A of a space (X, τ_1, τ_j) is called a (i, j) - $g^\#$ semi-closed set (written (i, j) - $g^\#s$ -closed) if $\tau_j\text{-scl}(A) \subseteq U$ whenever $A \subseteq U$ and U is αg -open in τ_i

Remark 3.2: By setting $\tau_i = \tau_j$ in Definition 3.1, a (i, j) - $g^\#$ semi-closed set is a $g^\#$ semi-closed set [17].

Theorem 3.3: Every τ_j -semi-closed (resp. τ_j - α -closed, (i,j) - $g^\#$ s -closed) set is a (i,j) - $g^\#$ s -closed (resp. (i,j) - $g^\#$ s -closed, (i,j) -gs -closed) set. The converses are not true.

Proof: Follows from the definitions.

The following examples show that a $(1, 2)$ - $g^\#$ s -closed (resp. $(1, 2)$ -gs-closed) set need not be τ_2 -semi-closed, τ_2 - α -closed.

Example 3.4: Let $X=\{a, b, c\}$, $\tau_1 = \{\phi, X, \{a, b\}\}$, $\tau_2 = \{\phi, X, \{a\}\}$ then $\{a, c\}$ is $(1,2)$ - $g^\#$ s -closed but not τ_2 -semi-closed.

Example 3.5: Let $X=\{a, b, c\}$, $\tau_1 = \{\phi, X, \{a\}\}$, $\tau_2 = \{\phi, X, \{a\}, \{b, c\}\}$ then $\{b\}$ is $(1,2)$ -gs -closed but not $(1,2)$ - $g^\#$ s -closed.

Example 3.6: Let $X=\{a, b, c\}$, $\tau_1 = \{\phi, X, \{a, b\}\}$, $\tau_2 = \{\phi, X, \{a\}\}$ then $\{a, c\}$ is $(1,2)$ - $g^\#$ s -closed but not τ_2 - α -closed. Thus the class of (i,j) - $g^\#$ s -closed sets properly contains the class of τ_j -closed sets, the class of τ_j - α -closed sets and the class of τ_j -semi-closed sets.

Theorem 3.7: Every τ_j -closed (resp. (i, j) - $g^\#$ s -closed) set is (i, j) - $g^\#$ s -closed (resp. (i, j) -gsp -closed) set. But the converses are not true.

Proof: Proof follows from the definitions.

Example 3.8: Let $X=\{a, b, c\}$, $\tau_1 = \{\phi, X, \{a\}\}$, $\tau_2 = \{\phi, X, \{a\}, \{b, c\}\}$ then $\{b\}$ is $(1,2)$ -gsp-closed but not $(1,2)$ - $g^\#$ s -closed.

Example 3.9: Let $X=\{a, b, c\}$, $\tau_1 = \{\phi, X, \{a, b\}\}$, $\tau_2 = \{\phi, X, \{a\}\}$ then $\{b\}$ is $(1,2)$ - $g^\#$ s -closed but not τ_2 -closed. So the class of (i,j) - $g^\#$ s -closed sets (resp. (i, j) -gsp-closed) sets properly contains the class of τ_j -closed (resp. (i, j) - $g^\#$ s -closed) sets. The class of (i, j) - $g^\#$ s -closed sets properly contains the class of τ_j - α closed sets in view of the above theorem since every τ_j - α closed set is a τ_j -semi-closed set.

The following examples show that (i, j) - $g^\#$ s -closedness is independent from (i, j) -g-closedness, (i, j) - α -closedness, (i, j) - α g-closedness, (i, j) -gs-closedness.

Example 3.10: Let $X=\{a, b, c\}$, $\tau_1 = \{\phi, X, \{c\}, \{a, b\}\}$, $\tau_2 = \{\phi, X, \{a\}\}$ then the set $\{a, c\}$ is $(1,2)$ -g-closed set, $(1,2)$ - α g-closed set, $(1,2)$ -gs-closed set but not $(1,2)$ - $g^\#$ s -closed.

Proposition 3.11: If A is (i,j) - $g^\#$ s -closed set such that $A \subseteq B \subseteq \tau_j\text{-Scl}(A)$ then B is also (i,j) - $g^\#$ s -closed.

Proof: Let U be τ_j - α g-open set such that $B \subseteq U$ then $A \subseteq B \subseteq U$. Since A is (i,j) - $g^\#$ s -closed, $\tau_j\text{-Scl}(A) \subseteq U$.

Now $B \subseteq \tau_j\text{-Scl}(A)$ implies $\tau_j\text{-Scl}(B) \subseteq \tau_j\text{-Scl}(\tau_j\text{-Scl}(A)) = \tau_j\text{-Scl}(A) \subseteq U \Rightarrow \tau_j\text{-Scl}(B) \subseteq U$ Hence B is also (i,j) - $g^\#$ s -closed.

Proposition 3.12: If A is (i,j) - $g^\#$ s -closed then $\tau_j\text{-Scl}(A) - A$ contains no non-empty τ_j - α g-closed set.

Proof: Let A be an (i,j) - $g^\#$ s -closed set and F be a non-empty τ_j - α g-closed subset such that $F \subseteq \tau_j\text{-Scl}(A) - A = \tau_j\text{-Scl}(A) \cap A^c \therefore F \subseteq \tau_j\text{-Scl}(A)$ and $F \subseteq A^c$. Since F^c is τ_j - α g-open and A is (i,j) - $g^\#$ s -closed we have, $\tau_j\text{-Scl}(A) \subseteq F^c$ i.e. $F \subseteq (\tau_j\text{-Scl}(A))^c$. Hence $F \subseteq \tau_j\text{-Scl}(A) \cap (\tau_j\text{-Scl}(A))^c = \phi \therefore \tau_j\text{-Scl}(A) - A$ contains no non-empty τ_j - α g-closed set.

Corollary 3.13: If A is (i,j) - $g^\#$ s -closed set in (X, τ_i, τ_j) , then A is τ_j -semi-closed iff

$\tau_j\text{-Scl}(A) - A$ is τ_i - α g-closed.

Proof: Necessity: If A is τ_j -semi-closed then $\tau_j\text{-Scl}(A) = A$ i.e. $\tau_j\text{-Scl}(A) - A = \phi$ and hence $\tau_j\text{-Scl}(A) - A$ is τ_i - α g-closed. [by prop.3.12]

Sufficiency: If $\tau_j\text{-Scl}(A) - A$ is τ_i - α g-closed then by proposition 3.12 we have, $\tau_j\text{-Scl}(A) - A = \phi$ [since A is (i,j) - $g^\#$ s -closed] $\therefore \tau_j\text{-Scl}(A) = A$. Hence A is τ_j -semi-closed.

Proposition 3.14: For each element x of (X, τ_i, τ_j) , $\{x\}$ is τ_i - α g-closed (or) $\{x\}^c$ is (i,j) - $g^\#$ s -closed.

Proof: If $\{x\}$ is not τ_i - α g-closed then the only τ_i - α g-open set containing $X-\{x\}$ is X . Thus $X-\{x\}$ is (i,j) - $g^\#$ s-closed. i.e $\{x\}^c$ is (i,j) - $g^\#$ s-closed. Hence Proved.

Proposition 3.15: If A is an τ_i - α g-open and (i,j) - $g^\#$ s-closed set of (X, τ_i, τ_j) then A is τ_j -semi-closed.

Proof: Let A be τ_i - α g-open and (i,j) - $g^\#$ s-closed. Since A is (i,j) - $g^\#$ s-closed, we have τ_j -scl(A) $\subseteq U$ whenever $A \subseteq U$ and U is τ_i - α g-open $\Rightarrow \tau_j$ -scl(A) = $A \Rightarrow A$ is τ_j -semi-closed.

Remark 3.16: An (i,j) - $g^\#$ s-closed set need not be (j,i) - $g^\#$ s-closed.

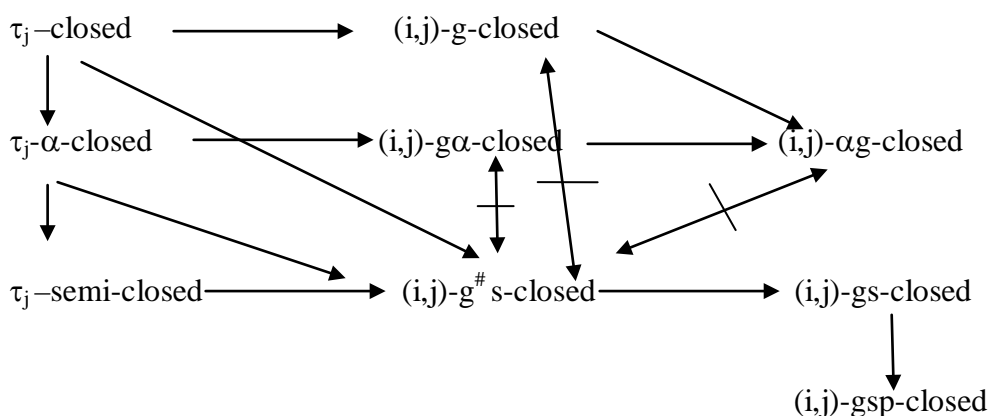

Proof: Consider the Example Let $X = \{a, b, c\}$, $\tau_1 = \{\emptyset, X, \{a, b\}\}$, $\tau_2 = \{\emptyset, X, \{a\}\}$ then $\{b\}$ is $(1, 2)$ - $g^\#$ s-closed but not $(2, 1)$ - $g^\#$ s-closed

Definition 3.17: The family of all (i,j) - $g^\#$ s-closed set in (X, τ_i, τ_j) is defined as $D^\# S(i,j)$

Proposition 3.18: If $A, B \in D^\# S(i,j)$ then $A \cup B \in D^\# S(i,j)$

Proof: Let $A, B \in D^\# S(i,j)$. Let us assume that $A \cup B \subseteq U$ where U is τ_i - α g-open. Implies $A \subseteq U$ and U is τ_i - α g-open $\Rightarrow \tau_j$ -scl(A) $\subseteq U$ and $B \subseteq U$ and U is τ_i - α g-open $\Rightarrow \tau_j$ -scl(B) $\subseteq U$. Hence τ_j -scl(A) $\cup \tau_j$ -scl(B) $\subseteq U$ but τ_j -scl($A \cup B$) $\subseteq \tau_j$ -scl(A) $\cup \tau_j$ -scl(B) $\subseteq U \Rightarrow \tau_j$ -scl($A \cup B$) $\subseteq U$. Therefore $A \cup B$ is (i,j) - $g^\#$ s-closed hence $A \cup B \in D^\# S(i,j)$. Hence proved.

The following figure shows the relationships of (i,j) - $g^\#$ s-closed sets with other sets

where $A \rightarrow B$ (resp. $A \not\leftrightarrow B$) represents A implies B but not conversely (resp. A and B are independent).

4. Applications of (i, j) - $g^\#$ s-closed Set:

In this chapter we introduce four new spaces namely (i,j) - $T_b^\#$ space, (i,j) - $T_b^\#$ space, (i,j) - $T_b^{##}$ space, (i,j) - $T_b^\#$ space. We now introduce a new space (i,j) - $T_b^\#$ space.

Definition 4.1: A space (X, τ_i, τ_j) is called an (i,j) - $T_b^\#$ space if every (i,j) - $g^\#$ s-closed set is τ_j -semi-closed.

Proposition 4.2: Every (i,j) - $T_{1/2}$ space is an (i,j) - $T_b^\#$ space but not conversely.

Proof: Let (X, τ_i, τ_j) be (i,j) - $T_{1/2}$ -space and A be a (i,j) - $g^\#$ s-closed set of $(X, \tau_i, \tau_j) \therefore A$ is (i,j) -gs-closed. Since (X, τ_i, τ_j) is (i,j) - $T_{1/2}$ space, A is τ_j -semi-closed set of (X, τ_i, τ_j)

$\therefore (X, \tau_i, \tau_j)$ is an (i,j) - $T_b^\#$ space.

The converse of above proposition need not be true which is shown by the following example.

Example 4.3: Consider the example $X = \{a, b, c\}$, $\tau_1 = \{\emptyset, X, \{a\}\}$, $\tau_2 = \{\emptyset, X, \{a, \{b, c\}\}$ then (X, τ_1, τ_2) is $(1,2)$ - $T_b^\#$ space but not $(1,2)$ - $T_{1/2}$ -space.

Theorem 4.4: Every (i,j) - T_b space is an (i,j) - $T_b^{\#}$ space but not conversely.

Proof: Let (X, τ_i, τ_j) be a (i,j) - T_b space implies every (i,j) -gs-closed set is τ_j -closed. Let A be a (i,j) -g[#]s-closed set. We know that every (i,j) -g[#]s-closed set is (i,j) -gs-closed hence A is (i,j) -gs-closed. Therefore A is τ_j -closed. But every τ_j -closed set is τ_j -semi-closed. Implies A is τ_j -semi-closed. hence (X, τ_i, τ_j) is a (i,j) - $T_b^{\#}$ space. The converse is not true which is shown by the following example.

Example 4.5: Let $X = \{a, b, c\}$, $\tau_1 = \{\emptyset, X, \{a\}\}$, $\tau_2 = \{\emptyset, X, \{a\}, \{b, c\}\}$ then (X, τ_1, τ_2) is $(1,2)$ - $T_b^{\#}$ space but not $(1,2)$ - T_b space

Remark 4.6: A $(1, 2)$ - $T_b^{\#}$ space need not be a $(1, 2)$ - T_b space

Proof: Let $X = \{a, b, c\}$, $\tau_1 = \{\emptyset, X, \{a\}\}$, $\tau_2 = \{\emptyset, X, \{a\}, \{b, c\}\}$ then (X, τ_1, τ_2) is $(1,2)$ - $T_b^{\#}$ space but not $(1,2)$ - T_b space

Characterization of (i,j) - $T_b^{\#}$ space

Theorem 4.7: For a space (X, τ_i, τ_j) the following conditions are equivalent.

1. (X, τ_i, τ_j) is an (i, j) - $T_b^{\#}$ space
2. Every singleton of X is either τ_i - α g-closed or τ_j -semi-open

Proof: To Prove (1) \Rightarrow (2) Let $x \in X$ and suppose that $\{x\}$ is not τ_i - α g-closed. Then $X - \{x\}$ is (i,j) -g[#]s-closed set since X is the only τ_i - α g-open set containing $X - \{x\}$. By propositions 3.13 and 3.14 we have, $X - \{x\}$ is τ_j -semi-closed. (i.e) $\{x\}$ is τ_j -semi-open

To Prove (2) \Rightarrow (1) Let A be a (i,j) -g[#]-closed set of (X, τ_i, τ_j) . Clearly $A \subseteq \tau_j - scl(A)$. Let $x \in X$. by (2) $\{x\}$ is either τ_i - α g-closed or τ_j -semi-open

Case (i) Suppose $\{x\}$ is τ_i - α g-closed. If $x \notin A$, then $\tau_j - scl(A) - A$ contains the τ_i - α g-closed set $\{x\}$ and A is (i,j) -g[#]s-closed set. By theorem 3.13, we arrive at a contradiction. Thus $x \in A$.

Case (ii) Suppose that $\{x\}$ is τ_j -semi-open. Since $x \in \tau_j - scl(A)$, then $\{x\} \cap A \neq \emptyset$. So $x \in A$. Thus in any case $x \in A$. So $\tau_j - scl(A) \subseteq A \therefore A = \tau_j - scl(A)$ (or) equivalently A is τ_j -semi-closed. Thus (X, τ_i, τ_j) is an (i,j) - $T_b^{\#}$ space.

We now introduce a new space (i,j) - $T_b^{\#}$

Definition 4.8: A space (X, τ_i, τ_j) is called (i,j) - $T_b^{\#}$ space if every (i,j) -g[#]s-closed set is τ_j -closed.

Theorem 4.9: Every (i,j) - $T_b^{\#}$ space is an (i,j) - $T_b^{\#}$ space but not conversely.

Proof: Let (X, τ_i, τ_j) be (i,j) - $T_b^{\#}$ space. \Rightarrow Every (i,j) -g[#]s-closed set is τ_j -closed. Therefore every (i,j) -g[#]s-closed set is τ_j -semi-closed. Hence (X, τ_i, τ_j) is (i,j) - $T_b^{\#}$ space. Hence proved.

Example 4.10: Let $X = \{a, b, c\}$, $\tau_1 = \{\emptyset, X, \{c\}, \{a, b\}\}$, $\tau_2 = \{\emptyset, X, \{a\}\}$ then (X, τ_1, τ_2) is $(1,2)$ - $T_b^{\#}$ space but not $(1,2)$ - $T_b^{\#}$ space.

Theorem 4.11: Every (i,j) - T_b space is (i,j) - $T_b^{\#}$ space but not conversely.

Proof: Let (X, τ_i, τ_j) be (i,j) - T_b space and A be a (i,j) -g[#]s-closed set

Then by theorem 3.3 A is (i,j) -gs-closed. Since (X, τ_i, τ_j) is a (i,j) - T_b space, then A is τ_j -closed.

$\therefore (X, \tau_i, \tau_j)$ is a (i,j) - $T_b^{\#}$ space. Hence proved.

Example 4.12: Let $X = \{a, b, c\}$, $\tau_1 = \{\emptyset, X, \{a\}\}$, $\tau_2 = \{\emptyset, X, \{a\}, \{b, c\}\}$. Then (X, τ_1, τ_2) is $(1,2)$ - $T_b^{\#}$ space but not $(1,2)$ - T_b space

Theorem 4.13: If (X, τ_i, τ_j) is a (i,j) - $T_b^{\#}$ space, then every singleton of X is either τ_i - α g-closed or τ_j -open.

Proof: Let $x \in X$ and suppose that $\{x\}$ is not τ_i - αg -closed. Then $X - \{x\}$ is not τ_i - αg -open. Then X is the only τ_i - αg -open set containing $X - \{x\}$. So $X - \{x\}$ is (i,j) - $g^\#$ -s-closed. Since (X, τ_i, τ_j) is a (i,j) - $T_b^\#$ space, then $X - \{x\}$ is τ_j -closed or equivalently $\{x\}$ is τ_j -open.

Remark 4.14: (i,j) - $T_b^\#$ ness is independent from (i,j) - T_b ness and (i,j) - $T_{1/2}$ ness

Proof: Consider the space $(X, \tau_1, \tau_2), X = \{a, b, c\}, \tau_1 = \{\phi, X, \{a\}\}, \tau_2 = \{\phi, X, \{a\}, \{b, c\}\}$ Then (X, τ_1, τ_2) is $(1,2)$ - $T_b^\#$ space but not $(1,2)$ - $T_{1/2}$ -space and $(1,2)$ - T_b space.

We introduce another new space (i,j) - $T_b^{\#\#}$ space

Definition 4.15: A space (X, τ_i, τ_j) is called (i,j) - $T_b^{\#\#}$ space if every (i,j) - $g^\#$ -s-closed set is τ_j - α -closed

Theorem 4.16: Every (i,j) - $T_b^\#$ space $((i,j)$ - $T_b)$ space is a (i,j) - $T_b^{\#\#}$ space but not conversely.

Proof: Let (X, τ_i, τ_j) be a (i,j) - $T_b^\#$ space and A be a (i,j) - $g^\#$ -s-closed set of (X, τ_i, τ_j) . Since (X, τ_i, τ_j) is a (i,j) - $T_b^\#$ space, A is τ_j -closed. Since every τ_j -closed set is τ_j - α -closed set. Implies A is τ_j - α -closed. $\therefore (X, \tau_i, \tau_j)$ is a (i,j) - $T_b^{\#\#}$ space. Let (X, τ_i, τ_j) be (i,j) - T_b space. \Rightarrow every (i,j) - g -s-closed set is τ_j -closed. Let A be (i,j) - $g^\#$ -s-closed. We know that every (i,j) - $g^\#$ -s-closed set is (i,j) - g -s-closed implies A is (i,j) - g -s-closed. Since (X, τ_i, τ_j) is (i,j) - T_b space $\Rightarrow A$ is τ_j -closed. But τ_j -closed is τ_j - α -closed.

$\therefore A$ is τ_j - α -closed. Hence every (i,j) - $g^\#$ -s-closed set is τ_j - α -closed $\Rightarrow (X, \tau_i, \tau_j)$ is (i,j) - $T_b^{\#\#}$ space.

Example 4.17: Let $X = \{a, b, c\}, \tau_1 = \{\phi, X, \{c\}, \{a, b\}\}, \tau_2 = \{\phi, X, \{a\}\}$ then (X, τ_1, τ_2) is $(1,2)$ - $T_b^{\#\#}$ space but not $(1,2)$ - $T_b^\#$ $((1,2)$ - $T_b)$ space.

Thus the class of (i,j) - $T_b^{\#\#}$ spaces properly contains the class of (i,j) - $T_b^\#$ spaces and hence the class of (i,j) - T_b spaces.

Theorem 4.18: If (X, τ_i, τ_j) is a (i,j) - $T_b^{\#\#}$ space, then every singleton of X is either τ_i - αg -closed or τ_j - α -open.

Proof: Suppose that (X, τ_i, τ_j) is a (i,j) - $T_b^{\#\#}$ space. Suppose that $\{x\}$ is not τ_i - αg -closed for some $x \in X$. Then $X - \{x\}$ is not τ_i - αg -open. Then X is the only τ_i - αg -open set containing $X - \{x\}$. So $X - \{x\}$ is a (i,j) - $g^\#$ -s-closed. Since (X, τ_i, τ_j) is a (i,j) - $T_b^{\#\#}$ space, $X - \{x\}$ is τ_j - α -closed or equivalently $\{x\}$ is τ_j - α -open.

We now introduce a new space (i,j) - $T_b^\#$ space

Definition 4.19: A space (X, τ_i, τ_j) is called a (i,j) - $T_b^\#$ space if every (i,j) - g -s-closed set is (i,j) - $g^\#$ -s-closed

Theorem 4.20: Every (i,j) - $T_{1/2}$ space is a (i,j) - $T_b^\#$ space but not conversely.

Proof: Let (X, τ_i, τ_j) be a (i,j) - $T_{1/2}$ space. Let A be a (i,j) - g -s-closed set. Since (X, τ_i, τ_j) is (i,j) - $T_{1/2}$ space, A is τ_j -semi-closed. Therefore A is (i,j) - $g^\#$ -s-closed. Hence (X, τ_i, τ_j) is a (i,j) - $T_b^\#$ space. Hence proved.

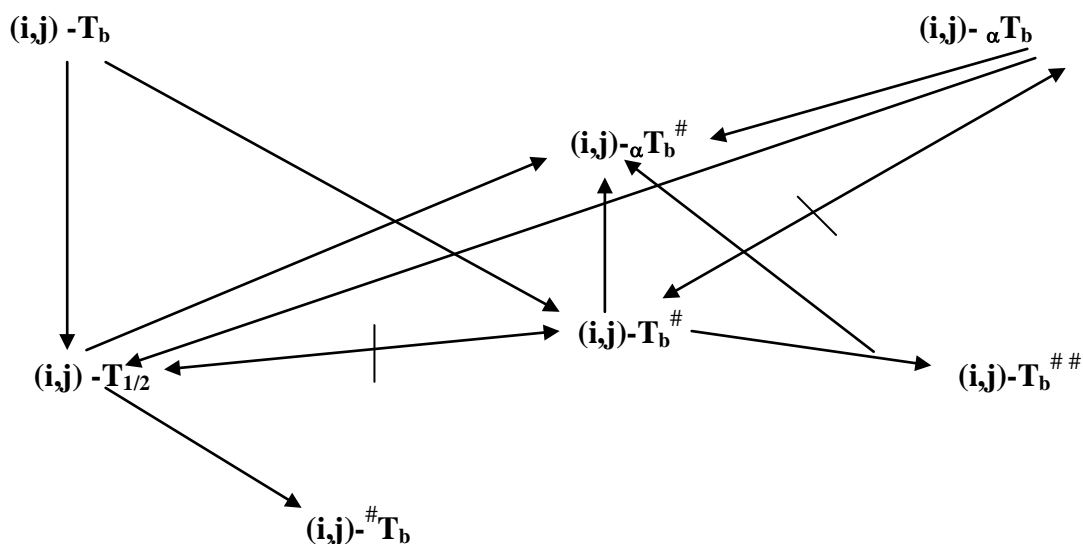

Example 4.21: Let $X = \{a, b, c\}, \tau_1 = \{\phi, X, \{a, c\}, \{c\}\}, \tau_2 = \{\phi, X, \{a\}\}$ then (X, τ_1, τ_2) is $(1,2)$ - $T_b^\#$ space but not $(1,2)$ - $T_{1/2}$ space.

Remark 4.22: A (i,j) - $T_b^\#$ space need not be a (i,j) - T_b $((i,j)$ - $T_b)$ space.

Proof: In example 4.21 we have (X, τ_1, τ_2) is $(1,2)$ - $T_b^\#$ space but not $(1,2)$ - T_b space and $(1,2)$ - T_b space.

Theorem 4.23: A space (X, τ_i, τ_j) is (i,j) - $T_{1/2}$ -space if and only if (X, τ_i, τ_j) is (i,j) - $T_b^\#$ and (i,j) - $T_b^\#$ space.

Proof: Let (X, τ_i, τ_j) be a (i,j) - $T_{1/2}$ space. By proposition 3.3, every (i,j) - $T_{1/2}$ is an (i,j) - $T_b^\#$ space. But every (i,j) - $T_{1/2}$ space is a (i,j) - $T_b^\#$ space. $\therefore (X, \tau_i, \tau_j)$ is a (i,j) - $T_b^\#$ and (i,j) - $T_b^\#$ space. Conversely, suppose that (X, τ_i, τ_j) is a (i,j) - $T_b^\#$ and (i,j) - $T_b^\#$ space. Let A be (i,j) - g -s-closed set. Since every (i,j) - g -s-closed set is (i,j) - g -closed $\Rightarrow A$ is (i,j) - g -s-closed. Since (X, τ_i, τ_j) is a (i,j) - $T_b^\#$ space, A is (i,j) - $g^\#$ -s-closed set. Since (X, τ_i, τ_j) is an (i,j) - $T_b^\#$ space, A is τ_j -semi-closed. \therefore by theorem 6.5[8], (X, τ_i, τ_j) is a (i,j) - $T_{1/2}$ space. Hence proved. The following diagram shows the inter relationships between the separation axioms discussed in this section.

where $A \rightarrow B$ (resp. $A \not\rightarrow B$) represents A implies B but B need not imply A (resp. A and B are independent).

5. $g^\#$ -continuous maps in bitopological spaces:

We introduce the following definition.

Definition 5.1: A function $f : (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$ is called (i, j) - $g^\#$ -continuous if $f^{-1}(V)$ is (i, j) - $g^\#$ -closed set of (X, τ_1, τ_2) for every closed set V of (Y, σ_1, σ_2) .

Proposition 5.2: If $f : (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$ is τ_j - σ_k -continuous then it is (i, j) - $g^\#$ -continuous but not conversely.

Proof: follows from the definitions.

Example 5.3: Let $X = \{a, b, c\}$, $\tau_1 = \{\emptyset, X, \{a, b\}\}$, $\tau_2 = \{\emptyset, X, \{a\}\}$ and $Y = \{p, q\}$, $\sigma_1 = \{\emptyset, Y, \{p\}\}$, $\sigma_2 = \{\emptyset, Y, \{q\}\}$. Define a map $f : (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$ by $f(a) = q$, $f(b) = f(c) = p$. then f is $(1, 2)$ - $g^\#$ -continuous but not τ_1 - σ_2 -continuous.

Proposition 5.4: If $f : (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$ is (i, j) - $g^\#$ -continuous, then it is (i, j) - g -continuous and (i, j) - g -sp-continuous but not conversely.

Proof: follows from the definitions.

The converses are not true which is shown by the following examples.

Example 5.5: Let $X = \{a, b, c\}$, $\tau_1 = \{\emptyset, X, \{a\}\}$, $\tau_2 = \{\emptyset, X, \{a\}, \{b, c\}\}$ and $Y = \{p, q\}$, $\sigma_1 = \{\emptyset, Y, \{p\}\}$, $\sigma_2 = \{\emptyset, Y, \{q\}\}$. Define a map $f : (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$ by $f(a) = f(c) = q$, $f(b) = p$. then f is $(1, 2)$ - g -continuous but not $(1, 2)$ - $g^\#$ -continuous.

Example 5.6: Let $X = \{a, b, c\}$, $\tau_1 = \{\emptyset, X, \{a\}\}$, $\tau_2 = \{\emptyset, X, \{a\}, \{b, c\}\}$ and $Y = \{p, q\}$, $\sigma_1 = \{\emptyset, Y, \{p\}\}$, $\sigma_2 = \{\emptyset, Y, \{q\}\}$. Define a map $f : (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$ by $f(a) = f(c) = q$, $f(b) = p$. then f is $(1, 2)$ - g -sp-continuous but not $(1, 2)$ - $g^\#$ -continuous.

Remark 5.7: (I, j) - $g^\#$ -continuous and (i, j) - g -continuous are independent which are shown by the following example.

Let $X = \{a, b, c\}$, $\tau_1 = \{\emptyset, X, \{c\}, \{a, b\}\}$, $\tau_2 = \{\emptyset, X, \{a\}\}$ and $Y = \{p, q\}$, $\sigma_1 = \{\emptyset, Y, \{p\}\}$, $\sigma_2 = \{\emptyset, Y, \{q\}\}$. Define a map $f : (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$ by $f(a) = f(c) = q$, $f(b) = p$. then f is $(1, 2)$ - g -continuous but not $(1, 2)$ - $g^\#$ -continuous.

Theorem 5.8: Let $f : (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$ be a map.

1. If (X, τ_1, τ_2) is an (i, j) - $T_{1/2}$ space then f is (i, j) - g -continuous if it is (i, j) - $g^\#$ -continuous.
2. If (X, τ_1, τ_2) is an (i, j) - $T_b^\#$ space then f is τ_j - σ_k -continuous. If it is (i, j) - $g^\#$ -continuous.

Proof:

1. Let V be a σ_k -closed set. Since f is (i, j) - g -continuous, $f^{-1}(V)$ is (i, j) - g -closed. But (X, τ_1, τ_2) is an (i, j) - $T_{1/2}$ space.

We have every (i, j) - g -closed set is τ_j -closed.

We know that every τ_j -closed set is (i, j) - $g^\#$ -closed.

$\therefore f^{-1}(V)$ is (i, j) - $g^\#$ -closed. Hence f is (i, j) - $g^\#$ -continuous.

2. Obviously, f is (i, j) - $g^\#$ -continuous. Conversely, suppose that f is (i, j) - $g^\#$ -continuous. Let V be a σ_k -closed set.

Since f is (i, j) - $g^\#$ -continuous

we have $f^{-1}(V)$ is (i, j) - $g^\#$ -closed. But (X, τ_1, τ_2) is an (i, j) - $T_b^\#$ space we have

$f^{-1}(V)$ is τ_j -closed $\therefore f$ is τ_j - σ_k -continuous. Hence proved.

Theorem 5.9: Every τ_j - σ_k -semi-continuous map is (i, j) - $g^\#$ -continuous but not conversely.

Proof: obvious.

The following example supports that the converse of the above theorem is not true in general.

Example 5.10: Let $X = \{a, b, c\}$, $\tau_1 = \{\phi, X, \{a, b\}\}$, $\tau_2 = \{\phi, X, \{a\}\}$ and $Y = \{a, b, c\}$, $\sigma_1 = \{\phi, Y, \{a\}\}$, $\sigma_2 = \{\phi, Y, \{b, c\}\}$. Define a map $f: (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$ by $f(a) = b$, $f(b) = a$, $f(c) = c$. then f is $(1, 2)$ - $g^\#$ -continuous but not τ_1 - σ_2 -semi-continuous.

Theorem 5.11: Every τ_j - σ_k - α -continuous map is (i, j) - $g^\#$ -continuous. But not conversely.

Proof: follows from definitions.

The converse of the above theorem is not true which is shown by the following example.

Example 5.12: Let $X = \{a, b, c\}$, $\tau_1 = \{\phi, X, \{a, b\}\}$, $\tau_2 = \{\phi, X, \{a\}\}$ and $Y = \{a, b, c\}$, $\sigma_1 = \{\phi, Y, \{a\}\}$, $\sigma_2 = \{\phi, Y, \{b, c\}\}$. Define a map $f: (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$ by $f(a) = b$, $f(b) = a$, $f(c) = c$. then f is $(1, 2)$ - $g^\#$ -continuous but not τ_1 - σ_2 - α -continuous.

Thus the class of (i, j) - $g^\#$ -continuous maps properly contains the class of τ_j - σ_k -continuous maps, the class of τ_j - σ_k - α -continuous maps, the class of τ_j - σ_k -semi-continuous maps. And also the class of (i, j) - $g^\#$ -continuous maps is properly contained in the class of (i, j) - g -continuous maps and hence in the class of (i, j) - g -continuous maps.

Theorem 5.13: Let $f: (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$ be (i, j) - $g^\#$ -continuous map. If (X, τ_1, τ_2) , the domain of f is an (i, j) - $T_b^\#$ space, then f is τ_j - σ_k -semi-continuous.

Proof: Let V be σ_k -closed set in (Y, σ_1, σ_2) . Then $f^{-1}(V)$ is (i, j) - $g^\#$ -closed, since f is (i, j) - $g^\#$ -continuous. Since (X, τ_1, τ_2) is an (i, j) - $T_b^\#$ space, every (i, j) - $g^\#$ -closed set is τ_j -semi-closed $\Rightarrow f^{-1}(V)$ is τ_j -semi-closed hence f is τ_j - σ_k -semi-continuous. Hence proved.

Theorem 5.14: Let $f: (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$ be (i, j) - $g^\#$ -continuous map. If (X, τ_1, τ_2) , the domain of f is (i, j) - $T_b^{\#\#}$ space, then f is τ_j - σ_k - α -continuous.

Proof: Let V be σ_k -closed set in (Y, σ_1, σ_2) . Then $f^{-1}(V)$ is (i, j) - $g^\#$ -closed, since f is (i, j) - $g^\#$ -continuous. Since (X, τ_1, τ_2) is an (i, j) - $T_b^{\#\#}$ space, every (i, j) - $g^\#$ -closed set is τ_j - α -closed $\Rightarrow f^{-1}(V)$ is τ_j - α -closed hence f is τ_j - σ_k - α -continuous. Hence proved.

Theorem 5.15: Let $f: (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$ be (i, j) - $g^\#$ -continuous map. If (X, τ_1, τ_2) , the domain of f is (i, j) - $T_b^\#$ space, then f is τ_j - σ_k -continuous.

Proof: Let V be σ_k -closed set in (Y, σ_1, σ_2) . Then $f^{-1}(V)$ is (i, j) - $g^\#$ -closed, since f is (i, j) - $g^\#$ -continuous. Since (X, τ_1, τ_2) is an (i, j) - $T_b^\#$ space, every (i, j) - $g^\#$ -closed set is τ_j -closed $\Rightarrow f^{-1}(V)$ is τ_j -closed hence f is τ_j - σ_k -continuous. Hence proved.

Theorem 5.16: Let $f: (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$ be (i, j) - $g^{\#}$ -continuous map. If (X, τ_1, τ_2) , the domain of f is (i, j) - $T_b^{\#}$ space, then f is (i, j) - $g^{\#}$ s -continuous.

Proof: Let V be σ_k -closed set in (Y, σ_1, σ_2) .

Then $f^{-1}(V)$ is (i, j) - $g^{\#}$ s -closed, since f is (i, j) - $g^{\#}$ -continuous. Since (X, τ_1, τ_2) is an (i, j) - $T_b^{\#}$ space we have every (i, j) - $g^{\#}$ s -closed set is (i, j) - $g^{\#}$ -closed. $\Rightarrow f^{-1}(V)$ is (i, j) - $g^{\#}$ -closed hence f is (i, j) - $g^{\#}$ s -continuous. Hence proved.

WE INTRODUCE THE FOLLOWING DEFINITION

Definition 5.17: A function $f: (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$ is called (i, j) - $g^{\#}$ s -irresolute map if $f^{-1}(V)$ is (i, j) - $g^{\#}$ s -closed set of (X, τ_1, τ_2) for every (i, j) - $g^{\#}$ s -closed set of (Y, σ_1, σ_2) .

Theorem 5.18: Every (i, j) - $g^{\#}$ s -irresolute map is (i, j) - $g^{\#}$ s -continuous but not conversely.

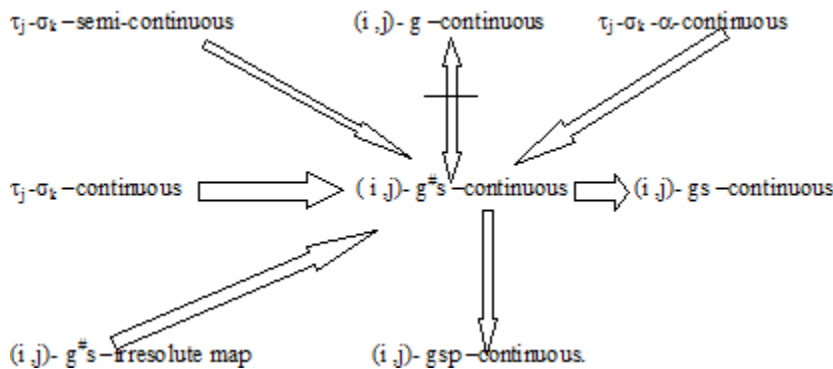

Proof: Let f is (i, j) - $g^{\#}$ s -irresolute Let V be σ_k -closed set. Then $f^{-1}(V)$ is (i, j) - $g^{\#}$ s -closed, since f is (i, j) - $g^{\#}$ s -irresolute. hence f is (i, j) - $g^{\#}$ s -continuous. Hence proved.

The converse of the above theorem is not true which is shown by the following example. Consider example 5.10

From example 5.10 we have, f is $(1, 2)$ - $g^{\#}$ s -continuous.

But f is not $(1, 2)$ - $g^{\#}$ s -irresolute because $\{b\}$ is $(1, 2)$ - $g^{\#}$ s -closed and $f^{-1}(\{b\}) = \{a\}$ and $\{a\}$ is not $(1, 2)$ - $g^{\#}$ s -closed. Hence proved.

Remark 5.19: The following diagram summarizes the above discussions.

where $A \rightarrow B$ (resp. $A \leftrightarrow B$) represents A implies B but B need not imply A (resp. A and B are independent).
